Washington, DC 20585

Questions of a general nature should be directed to:

Howard Walton (202/254-5500),
Director of the Survey Management Division;

Neal Moerschel (202/254-5640),
Chief of the Electric Data Systems Branch;

Lawrence Prete (202/254-5671),
Project Leader.

Specific information on sales, revenue, and average revenue may be directed to:

Linda M. Bromley (202/254-5653)

Preface

The *Electric Sales and Revenue* is prepared by the Survey Management Division, Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA); U.S. Department of Energy. This publication provides information about sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to residential, commercial, industrial, and other consumers throughout the United States. Previous publications presented data on typical electric bills at specified consumption levels as well as sales, revenue, and average revenue.

The sales, revenue, and average revenue per kilowatthour provided in the *Electric Sales and Revenue* are based on annual data reported by electric utilities for the calendar year ending December 31, 1991. The electric revenue reported by each electric utility includes the revenue billed for the amount of kilowatthours sold, revenue from income, unemployment and other State and local taxes, energy or demand charges, consumer service charges, environmental surcharges, franchise fees, fuel adjustments, and other miscellaneous charges. Average revenue per kilowatthour is defined as the cost per unit of electricity sold and is calculated by dividing retail sales into the associated electric revenue. The sales of electricity, associated revenue, and average revenue per kilowatthour provided in this report are presented at the national, Census division, State, and electric utility levels.

Target Audience

In the private sector, users of the *Electric Sales and Revenue* include researchers, analysts, and ultimately the policy- and decision-making members of electric utility companies. Other users include financial and investment institutions, economic development organizations, special interest groups, lobbyists, electric power associations, and the news media.

In the public sector, the users include analysts, researchers, statisticians, and other professionals engaged in regulatory, policy, and program areas for Federal, State, and local governments. The Congress and other legislative bodies will also be interested in general trends related to electricity at State and national levels. Data in this report can be used in analytic studies to evaluate new legislation and regulatory alternatives,

and to forecast future demand for electric power. Public service commissions and other special government groups share an interest in State-level statistics. These groups can compare the statistics for their States with those of other jurisdictions.

Coverage of Sources

Data published in the *Electric Sales and Revenue* are compiled from the Form EIA-861, "Annual Electric Utility Report." A brief description of the form follows. The form is described in more detail in Appendix B, "Technical Notes." Copies of the form and its instructions may be obtained from the National Energy Information Center (NEIC).

The Form EIA-861 is a census of electric utilities in the United States, its territories, and Puerto Rico. The form is used to collect information on the production and sale of electricity from approximately 3,250 electric utilities (Figure 1). This publication presents data on the number of consumers, sales, and revenue reported on the Form EIA-861. Average revenue per kilowatthour presented in this publication are calculated by dividing sales into revenue. Since electric rates vary based on energy usage, average revenue per kilowatthour are affected by changes in the volume of sales.

Data on sales, revenue, and average revenue per kilowatthour presented in this publication differ somewhat from estimated data collected on the Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior years. Both forms use sectoral classifications based on similar classification of consumers by electric utilities. At the national level, the figures reported on the Forms EIA-861 and EIA-826 correspond fairly closely; however, some large differences have been observed at the State level. (For a more detailed discussion, see Appendix B.)

Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are included only in detail-level tables, and not in the national, Census division, and State level statistics.

Profile

This chapter contains two sections. The "Background" section provides a discussion on 1) sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to ultimate consumers; 2) the classes of electric utility ownership; and 3) the classes of service or sectors. The "Year at a Glance" section provides a summary of pertinent statistics during the year related to sales of electricity, associated revenue, and average revenue per kilowatthour.

Background

Sales, Revenue, and Average Revenue per Kilowatt-hour. Electric power is an integral part of our way of life. It is indispensable to the factory, the commercial establishment, the home, and even most recreational facilities. The unavailability of electric power causes inconvenience to customers as well as the economic loss of industrial production. Electric companies are responsible for ensuring an adequate and reliable source of electricity to all consumers in their service territories at a reasonable cost.

The service territory of an electric utility is geographically distinct and is usually composed of many different combinations of consumers. Electric utilities classify their consumers by different factors, such as demand, rate schedule, Standard Industrial Classification (SIC) code, distribution voltage, accounting methods, end-use applications, and other social and economic characteristics. Electric utilities use consumer classifications for planning (load growth, peak demands) and for determining their sales and revenue requirements (cost of service), from which they derive their rates.

Average revenue per kilowatthour is defined as the cost per unit of electricity sold and is calculated by dividing retail electric revenue by the corresponding sales of electricity. The average revenue per kilowatthour is calculated for all consumers and for each sector (residential, commercial, industrial, and other sales). The average revenue per kilowatthour represents an average of all consumption levels and rates. The electric revenue used to derive the average revenue per kilowatthour is the operations revenue reported by the electric utility. Operations revenue includes energy or demand charges, consumer service charges, environmental surcharges, fuel adjustments, other miscellaneous charges, and State and local taxes. State and local taxes are collected by the electric utility

as part of their billing process but are expensed out and passed along to the appropriate taxing authority.

Average revenue per kilowatthour is affected by changes in the rate schedules used by the electric utilities and by changes in the volume of electricity sales. Because fixed charges remain constant regardless of the volume of sales, average revenue per kilowatthour will decrease as the volume of sales increases. A change in average revenue per kilowatthour may occur when the volume of electricity sales changes (because of an increase/decrease in the use of electricity by the individual consumer or an increase/decrease in the number of ultimate consumers) across all sectors or within a specific sector. Generally, the rate schedules used by electric utilities are designed so that revenue increases more slowly as the volume of sales increases, lowering the average revenue per kilowatthour. The net effect of these trends on the average revenue per kilowatthour presented in this publication has not been determined. Average revenue per kilowatthour is in part impacted by class of utility ownership and by class of service (sector). Consequently, data in this publication are presented by class of ownership and sector.

Classes of Ownership. The electric power industry in the United States is a combination of over 3,200 investor-owned, publicly owned, Federal, and cooperative electric utilities. Historically, investor-owned electric utilities have been most successful in serving large, consolidated markets where economies-of-scale afforded the lowest prices. However, publicly owned, Federal, and cooperative electric utilities all have a role in producing, transmitting, and distributing electricity.

Like all private businesses, the fundamental objective of an investor-owned utility is to produce a return for its investors. The investor-owned electric utility either distributes its profits to stockholders as dividends or reinvests these profits. It is granted a service monopoly in certain geographic areas and is obliged to serve all consumers. As franchised monopolies, these utilities are regulated and required to charge reasonable prices, to charge comparable prices to similar classifications of consumers, and to give consumers access to services under similar conditions. Most investor-owned electric utilities are operating companies that provide basic services for the generation, transmission, or distribution of electricity. The majority of investor-owned utilities perform all three functions. There are approximately

270 investor-owned electric utilities operating in all States except Nebraska. The electric utilities in Nebraska consist primarily of municipal systems and public power districts. In Hawaii electricity generation is supplied by investor-owned electric utilities or nonutility power producers such as Lihue Plantation. Investor-owned electric utilities currently account for more than 70 percent of all electric utility generating capability, generation, sales, and revenue in the United States.

Publicly owned electric utilities are nonprofit local government agencies established to provide service to their communities and nearby consumers at cost, returning excess funds to the consumer in the form of community contributions, more economic and efficient facilities, and lower rates. Publicly owned electric utilities (which number approximately 2,000) include municipals, public power districts, State authorities, irrigation districts, and other State organizations. Most municipal utilities simply distribute power, although some larger ones produce and transmit electricity as well. They obtain their financing from municipal treasuries and from revenue bonds secured by proceeds from the sale of electricity. Public power districts and projects are concentrated in Nebraska (which has no investor-owned electric utilities), Washington, Oregon, Arizona, and California. Voters in a public utility district (PUD) elect commissioners or directors to govern the district independent of any municipal government. State authorities, like the Power Authority of the State of New York or the South Carolina Public Service Authority, are agencies of their respective State government. Irrigation districts may have still other forms of organization. In the Salt River Project, votes for the board of directors are apportioned according to the size of landholdings.

Cooperative electric utilities are owned by their members and are established to provide electricity to those members. These electric utilities operate in rural areas with a lower concentration of consumers because these areas were historically viewed as uneconomical operations for investor-owned electric utilities. They are incorporated under State law and are usually directed by an elected board of directors, which in turn selects a manager. The Rural Electrification Administration, the National Rural Utilities Cooperative Finance Corporation, the Federal Financing Bank, and the Bank for Cooperatives are the most important sources of debt financing for electric cooperatives. There are approximately 950 electric cooperatives currently doing business in 47 States. Cooperative electric utilities do not operate in Connecticut, Hawaii, and Rhode Island, or in the District of Columbia.

There are 10 Federal electric utilities in the United States. They are the Department of Defense-U.S. Army Corps of Engineers; the Department of Energy-Alaska, Bonneville, Southeastern, Southwestern, and Western Area Power Administrations; the Department of Interior-U.S. Bureau of Indian Affairs and the U.S. Bureau of Reclamation; the Department of State-International Boundary and Water Commission; and the Tennessee Valley Authority. The Federal electric utilities are primarily generators and wholesalers of electricity rather than distributors to ultimate consumers. Federal electric utilities operate approximately 180 power plants and produce almost 9 percent of the electricity generated in the United States. Most of the power plants are Federal hydroelectric projects initially designed for flood control and irrigation purposes. Federal power is not sold for profit, but to recover the cost of operations. Most Federal generation is sold for resale to municipals, cooperative electric utilities, and other nonprofit preference customers, as required by law. There are three major Federal producers of electricity: the Tennessee Valley Authority (TVA), the largest Federal producer, the U.S. Army Corps of Engineers (USCE), and the U.S. Bureau of Reclamation (USBR). The TVA markets its own power while the generation by the USCE, except for the North Central Division (St. Mary's Falls at Sault St. Marie, Michigan), and the USBR is marketed by four of the Federal power marketing administrations (PMA): Bonneville, Southeastern, Southwestern, and Western Area. The four PMA's also purchase energy for resale from other electric utilities in the United States and Canada. Alaska, the fifth PMA, operates its own power plants and distributes power to ultimate consumers. The majority of electricity generated by Federal electric utilities is sold for resale, not to ultimate consumers.

Classes of Service (Sectors). In general, consumers are divided into classes or sectors based on the type of service they receive. The sectorial categorization of ultimate consumers is determined by the electric utility based on its service territory, size, location, ownership, and regulatory structure. The generic sectors (*residential, commercial, and industrial*) reflect the type of service consumers receive.

The residential sector includes electricity supplied to private household establishments and apartment buildings where energy is consumed primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying.

The commercial sector includes electricity supplied to nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, and retail stores; and health, social, and educational institutions. An electric utility may classify commercial consumers as those consumers whose demand or usage exceeds some specified limit. The limit may be set by the electric utility based on its rate schedule.

The industrial sector includes electricity supplied to manufacturing, construction, mining, agriculture, fishing, and forestry establishments -- Standard Industrial Classification (SIC) codes 1 through 39. An electric utility may classify industrial consumers using these SIC codes, or it may classify industrial consumers based on demand or usage exceeding some specified limit. As in the commercial sector, the limit may be set by the electric utility based on its rate schedule.

Sales to other consumers include public street and highway lighting, railroads and railways, municipalities, divisions or agencies of State and Federal Governments under special contracts or agreements, and other utility departments, as defined by the pertinent regulatory agency and/or electric utility. Sales to these consumers, as well as the residential, commercial, and industrial consumers may be classified differently by each electric utility because of different rates, demand levels, and the economic activities of the consumers.

The Year at a Glance

In 1991, total sales of electricity to ultimate consumers were 2,762 billion kilowatthours and total revenue was \$186 billion (Table 1). Sales to the residential sector in 1991 were 955 billion kilowatthours and revenue was \$77 billion. The commercial and industrial sectors had sales of 766 and 947 billion kilowatthours, and revenue of \$58 and \$46 billion, respectively. The average revenue per kilowatthour of electricity sold to ultimate consumers in the United States in 1991 was 6.7 cents (Table 2). The average revenue per kilowatthour for the residential sector was 8.0 cents in 1991. The average revenue per kilowatthour for the commercial and industrial sectors for 1991 was 7.5 and 4.8 cents, respectively.

Average Revenue by Sector and Type. Since Federal electric utilities have access to relatively low-cost financing and mostly utilize less expensive hydroelectric facilities, they have the lowest average revenue per kilowatthour of all the ownership classes and sectors. The average revenue per kilowatthour of publicly owned electric utilities in the residential sector, at 6.4 cents, was 15 percent below that for cooperative electric utilities at 7.5 cents; and 25 percent below that of investor-owned electric utilities at 8.5 cents, (Table 2).

The average revenue per kilowatthour of publicly owned electric utilities in the commercial sector, at 6.5 cents, was 11 percent below that for cooperative electric utilities at 7.3 cents and 16 percent below that for investor-owned electric utilities at 7.7 cents. For the industrial sector, publicly owned and cooperative electric utilities had average revenue per kilowatthour of 4.8 and 4.7 cents, 4 and 6 percent below that for investor-owned electric utilities at 5.0 cents.

Sales by Sector. Sales of electricity rose 2 percent in both 1991 and 1990. A record for total sales of electricity was set in 1991 at 2,762 billion kilowatthours. Actual sales in the residential sector grew more in 1991 than in 1990 while actual sales in the other major end-use sectors grew less in 1991 (Table 3). Sales of electricity to the residential and commercial sectors increased by 3 and 2 percent (31 and 15 billion kilowatthours) in 1991. Sales of electricity to the industrial sector increased by less than 1 percent (1 billion kilowatthours).

Revenue by Sector. While both sales and average revenue (cents/kilowatthour) increases contributed to total revenue increases over the last five years, 1991 was the first year in which increase in average revenue accounted for the majority of the total revenue increase (60 percent). Sales increases accounted for the majority of revenue increase in the previous five years.¹ The small volume of sales growth and contribution to revenues in 1991 may have been due to the recession. The total revenue from sales of electricity was 5 percent more than in 1990 (Table 3). Revenue increased by 6 percent for the residential sector and by 5 percent for the commercial sector in 1991. Revenue for the industrial sector increased by 2 percent in 1991. The majority of total revenue increase (55 percent) in the residential sector was due to sales increase, while in the industrial and commercial sectors, the majority of total revenue increases (94 and 58 percent, respectively) were due to increases in average revenue (cents/kilowatthour).

Sales by Type of Ownership. Among the ownership classes, investor-owned electric utilities accounted for 76 percent (2,111 billion kilowatthours) of total U.S. sales of electricity in 1991 (Table 4). Publicly owned electric utilities accounted for 14 percent (393 billion kilowatthours); electric cooperative utilities accounted for 7 percent (205 billion kilowatthours); and Federal electric utilities accounted for 2 percent (53 billion kilowatthours), of total U.S. sales in 1991. Investor-owned and publicly owned electric utilities both reported a 2-percent (39 and 8 billion kilowatthours, respectively) increase in 1991 sales of ultimate consumers compared to 1990. Sales of electricity for cooperative electric utilities increased by 2 percent (4 billion kilowatthours). Federal electric utilities reported a 3-percent (2 billion kilowatthours) decrease.

¹See Appendix B for the equations used in the calculation of effects of average revenue per kilowatthour and sales on change in revenue.

Revenue by Type of Ownership. All ownership classes reported increases in revenue from sales of electricity in 1991 compared to 1990 except Federal electric utilities. Cooperative and publicly owned electric utilities reported 3 and 2 percent increases, respectively. Investor-owned electric utilities reported a 5-percent increase in 1991 revenue, while Federal electric utilities reported a 12-percent decrease. (Table 4). The majority (64 percent) of total revenue increase for investor-owned utilities was due to increases in average revenue, while sales increases accounted for the majority of total revenue increases for the publicly owned and cooperative owned utilities (100 and 63 percent, respectively).²

Average Revenue by Type of Ownership. In 1991, Federal electric utilities continued to have the lowest average revenue per kilowatthour at 2.8 cents, a 10-percent decrease from 1990 (Table 11). Federal electric utilities generally have lower average revenue per kilowatthour because they are exempt from income tax, have access to lower interest loans, and use less expensive hydroelectric power. In addition, many Federal hydroelectric projects are multi-purpose projects and only a portion of the costs are allocated to electricity. Average revenue per kilowatthour for publicly owned electric utilities was also lower than that of

investor-owned electric utilities and cooperative electric utilities. Publicly owned electric utilities have access to low-cost capital and are not allowed to charge a return for profit. Publicly owned electric utilities had an average revenue per kilowatthour of 5.9 cents in 1991 which did not change from 1990.

Investor-owned electric utilities had an average revenue per kilowatthour of 7.0 cents in 1991, a 3-percent increase from 1990 (Table 11). Although cooperative electric utilities have access to low-cost loans through the Rural Electrification Administration, they had one of the highest average revenues per kilowatthour at 6.9 cents in 1991, a 1-percent increase from 1990. The higher average revenue per kilowatthour by this ownership group is at least partly attributable to the high cost of operating in remote rural areas having a low concentration of consumers and providing service to a higher percentage of residential customers than other classes of utilities. The lower load factor of residential customers as compared with other sectors (i.e., commercial and industrial) has an associated higher allocation of demand cost due to a lower utilization of generating equipment. In addition, many cooperatives do not generate electricity and as full requirement customers must pay requirement demand charges.

Table 1. Sales to Ultimate Consumers and Associated Revenue by Sector, 1991

Item	Residential	Commercial	Industrial	Other ¹	All Sectors
Sales (million kilowatthours) ..	955,417	765,664	946,583	94,339	2,762,003
Revenue (thousand dollars) ...	76,827,977	57,655,250	45,737,187	6,138,289	186,358,703

¹ Includes public street and highway lighting, other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Notes: •Totals may not equal sum of components because of independent rounding. •The Form EIA-861 data shown in this publication differ somewhat from Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," estimated data published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior years. See Appendix B for a detailed description of these differences.

Sales and Revenue

This chapter provides a discussion on revenue requirements, the allocation of revenue across sectors, and rate schedules. Also provided are summary statistics on the sale of electricity to ultimate consumers and the associated revenue. This information is provided at the national, Census division, and State levels.

Cost of Electricity

The process of determining the cost of electricity generally follows three stages: 1) revenue requirements are determined 2) the revenue is allocated to different classes of service (sectors) and 3) rate schedules for each sector are established.

Revenue Requirements. Revenue requirements are set to reimburse the electric utility for providing electric service. The revenue requirements reflect the anticipated cost of providing services for some period of time in the future, usually a year. Revenue requirements include investment depreciation, expenses for the production, transmission, and distribution systems, as well as sales costs, consumer costs, Federal and other taxes, and administration and general expenses. The revenue requirements also include an allowance for the profit of the electric utility, if applicable.

Allocation of Revenue. The cost of service to particular sectors and the mix of consumers served in the sectors provide guidelines for determining how much of the revenue must be collected from each sector. For example, the cost of service to the residential sector is usually higher than the cost to the commercial or industrial sectors because of the large number of consumers served, amount of distribution lines needed to provide the service, and the low consumption levels. The economic activity or type of business of the ultimate consumer is not necessarily the means by which electric utilities classify their consumers to determine revenue requirements and set rates. Electric utilities, in many instances, determine their revenue requirements and set their rates based on the level of demand and/or consumption of electricity.

The residential sector represents 88 percent of the total number of consumers but only accounts for 35 percent of the total sales of electricity and 41 percent of the revenue from those sales. The industrial sector possesses less than 1 percent of the total number of con-

sumers but accounts for 34 percent of the sales and 25 percent of the revenue. The commercial sector consists of 11 percent of the consumers, accounts for 28 percent of total sales and 31 percent of the revenue. The remaining share of sales is accounted for by the "other" sector, which includes public street and highway lighting, railroads and railways, municipalities, divisions or agencies of State and Federal Governments under special contracts or agreements, and other utility departments, as defined by the pertinent regulatory agency and/or electric utility. Investor-owned electric utilities serve approximately three-fourths of the total number of ultimate consumers. Publicly owned electric utilities and electric cooperatives serve nearly all the remaining ultimate consumers as federally owned electric utilities have very few retail sales and sell almost exclusively to other electric utilities.

Rate Schedules. In general, the rate schedules for most electric utilities are designed to allow for operation, generation, maintenance, rental fees for equipment, and demand and service charges. Operation, generation, maintenance, and rental fees for equipment are usually fixed charges that are assessed monthly or annually. Demand charges are also fixed, but they vary with respect to volume of sales. A more detailed discussion of these charges is contained in Chapter 3, "Average Revenue."

The rate schedules developed to generate revenue for electric utilities are unique to each utility. The rates reflect any number of considerations that are important to the economic welfare of the electric utility and may reflect other interests as well, such as residential rates that provide economic service to low-income families. Generally, commercial or industrial billings are determined more by the level of demand/consumption of electricity than by the type of economic activity in which the consumer is engaged.

For instance, while commercial and industrial consumers are billed according to a particular rate schedule that frequently reflects the type of business indicated by that schedule, there are exceptions. A light manufacturing establishment with a manufacturing process that consumes little energy could be billed at a commercial rate because its consumption is not high enough to fall into the industrial schedule. Conversely, a very large commercial building might have sufficiently large consumption to be billed at the industrial rate.

Sectorial classification of consumers may change over the course of a year as consumption varies. As a result, the rate schedule that would be applicable may vary. For example, a very large commercial building may have a high level of consumption during the summer because of air conditioning equipment and would be billed at industrial rates. However, in the winter, if the building is heated by gas, consumption of electricity may decline and commercial rates may be applied for billing purposes rather than industrial rates.

The authority for the approval of these rates is based on the class of utility ownership. For example, investor-owned electric utilities are regulated by State public service commissions and the Federal Energy Regulatory Commission. Publicly owned electric utilities, in

most States, are regulated by their consumer-owners through locally elected or appointed officials. A more detailed discussion on utility classes of ownership is contained in the "Introduction" section of the first chapter in this publication.

Data Sources. Tables 3 through 10 contain data on the retail sales of electricity, its associated revenue, and the average number of consumers at the national, Census and State levels by sector and class of utility ownership. Statistics contained in Tables 3 through 10 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands, are not included in the summary statistics.

Electricity provides energy to light homes and shopping centers, and to run factories.

Average Revenue per Kilowatthour

This chapter provides summary statistics on the average revenue per kilowatthour at the national, Census division, State, and electric utility levels.

Average Revenue per Kilowatthour at the National, Regional, and State Level

The average revenue per kilowatthour by sector and State is calculated by dividing total annual revenue by total annual retail sales for each sector and State. The resulting measurement is the cost per kilowatthour of electricity sold for providing service to a sector given the rate schedule of the electric utility for that particular sector. Many rate schedules have a minimum service charge and most have a declining rate per unit of consumption as consumption increases. Rate schedules for the commercial and industrial sectors almost always have a demand charge in addition to an energy charge. These charges lower the average revenue per kilowatthour as the average consumption increases.

The average revenue per kilowatthour for residential consumers is generally higher than for any other sector due in part to higher costs associated with serving many consumers who use relatively small amounts of electricity. These costs include direct-load costs (such as those for distribution lines, transformers, and meters) in addition to consumer or administrative costs. The industrial sector, which generally includes consumers with the highest use of electricity, has the lowest rates due to the economies of serving a few consumers who use relatively large amounts of electricity. Average revenue for the residential and commercial sectors increased fairly consistent from 1987 to 1991, but the average revenue for the industrial sector remained relatively flat. The residential sector's average revenue climbed 0.6 cents per kilowatthour from 7.4 cents in 1987 to 8.0 cents in 1991, and the commercial sector climbed 0.4 cents per kilowatthour from 7.1 cents in 1987 to 7.5 cents in 1991 (although it dropped in 1988). The other sector showed an increase in average revenue in the last two years, climbing 0.3 cents per kilowatthour from 6.1 cents in 1989 to 6.5 cents in 1991. The industrial sector dropped 0.1 cents per

kilowatthour from 1987 to 1988 to 4.7 cents per kilowatthour, stayed at that level through 1990 and increased back to the 1987 value of 4.8 cents per kilowatthour in 1991. The individual sector's average revenue is showing that some state utility commissions, during 1988 to 1990, probably approved lower rates for the industrial sector to better reflect the cost of services.

One of the most significant observations from this table is that the average revenue for all sectors grew at less than inflation, which averaged 4.0 percent³ annually from 1987 to 1991. Thus, average revenue for all sectors declined in real terms.

The average revenue by ownership class also exhibits some interesting trends. Both investor-owned and publicly owned utilities showed upward trends in average revenue, while the cooperatives remained relatively flat. The investor-owned utilities average revenue surpassed the cooperatives average revenue for the first time during this five year period in 1991. The average revenues for Federal utilities exhibited a declining trend, beginning at 3.8 cents per kilowatthour in 1987 and dropping to 2.8 cents in 1991.

Utility Demand Side-Management (DSM) programs designed to reduce system peak demands and energy requirements have become important components of utility load and resource plans. DSM programs are designed to modify consumption patterns and increase the efficient use of electricity. As a result, these programs may play a role in changing the consumers average consumption and average revenue per kilowatthour. The recently enacted Energy Policy Act of 1992 contains a subtitle that promotes conservation and energy efficiency by encouraging utilities to expand DSM programs. It requires utilities and their public utility commissions to consider requiring two new Federal standards that encourage DSM: integrated resource planning, which includes consideration of demand-side options with supply-side options; and cost recovery for energy efficiency programs that allows their profitability to be at least as attractive as supply-side option profitability.

³From Economic Report of President, February 1992, Implicit Price Deflator for Gross Domestic Product in 1987 was 100.0 and in 1991 was 117.0, resulting in an average annual growth rate of 4.0 percent.

Table 11. Average Revenue per Kilowatthour by Sector and Class of Ownership, 1987-1991

Investor-Owned	7.0	6.8	6.6	6.5	6.5
Publicly Owned	5.9	5.9	5.8	5.7	5.6
Cooperative	6.9	6.8	6.9	6.8	6.8
Federal	2.8	3.1	3.6	3.8	3.8
U.S. Average	6.7	6.6	6.5	6.4	6.4

¹ Includes public street and highway lighting, other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Notes: •The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales. •The Form EIA-861 data shown in this publication differ somewhat from Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," estimated data published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior years. See Appendix B for a detailed description of these differences.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

Public concern for stricter environmental standards and Federal regulations have forced electric utilities to reduce or eliminate the release of gaseous power plant emissions. Since environmental equipment can be a significant part of the cost of a power plant, the recent passage of the Clean Air Act Amendments (CAAA) of 1990 may impact rates further as the initial capital cost of installation and the recurring operation and maintenance (O&M) costs will affect utility revenue requirements.

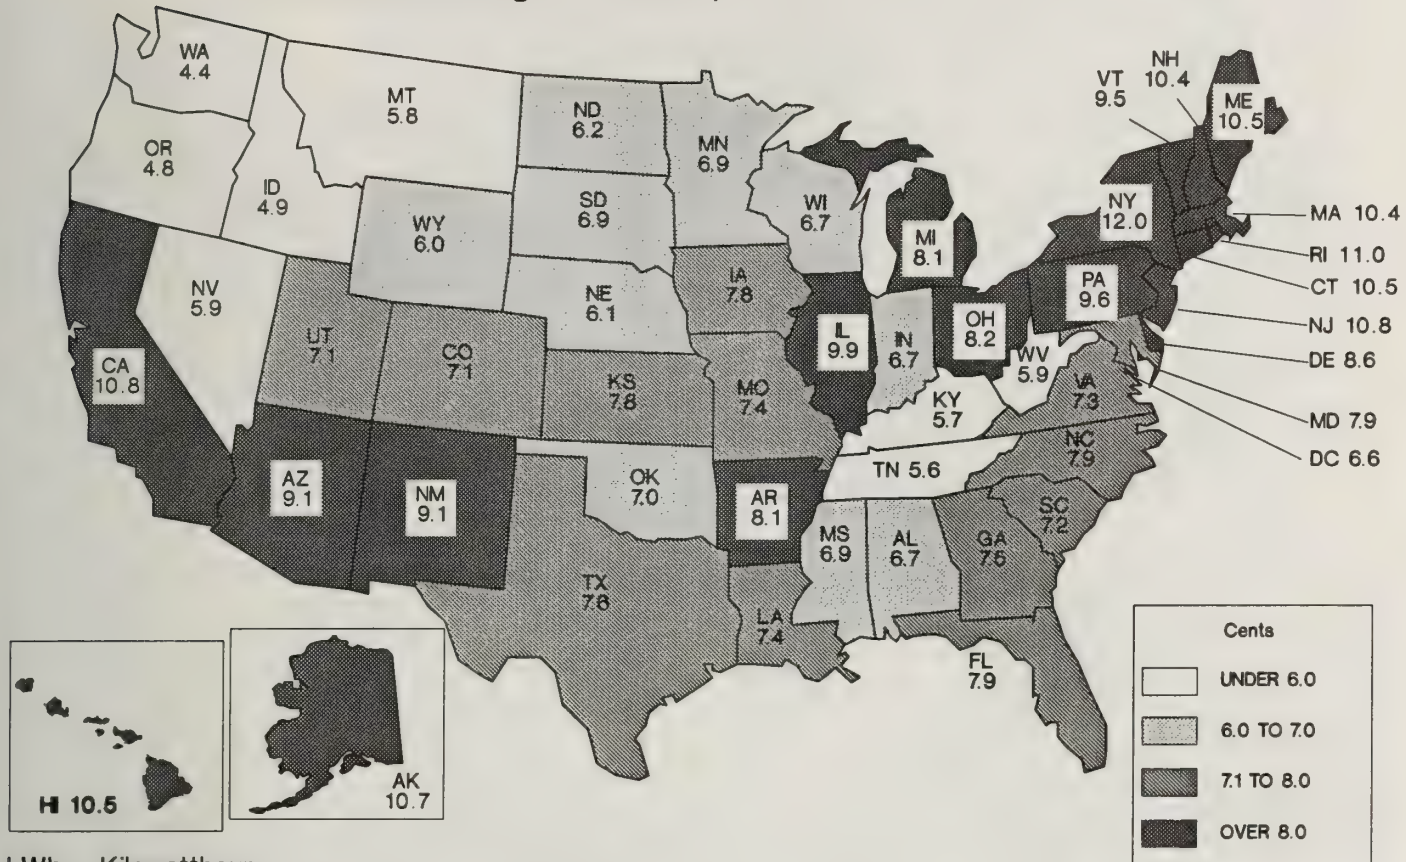

Federal electric utilities generally have the lowest average revenue per kilowatthour for the ownership classes because they have access to relatively low-cost financing and mostly utilize less expensive hydroelectric facilities. Because publicly owned electric utilities also have access to relatively low-cost financing and are nonprofit entities, they have lower average revenue per kilowatthour than investor-owned electric utilities. Although cooperative electric utilities have economic advantages similar to those of the publicly owned electric utilities, they generally serve sparsely populated areas and providing service to a higher percentage of residential customers than other classes of utilities. As a consequence, cooperative electric utilities generally have higher average revenue per kilowatthour than do investor-owned utilities.

Because of the type and availability of capacity and the cost of fuel, the average revenue per kilowatthour differs across U. S. Census divisions. Petroleum is generally a more expensive energy source than coal and natural gas. Therefore, the New England and Middle Atlantic Census Divisions tend to have an average revenue per kilowatthour that is higher than average because of their reliance on petroleum, whereas the East and West South Central Divisions rely on gas-fired generation and the East North Central and South Atlantic Census Divisions rely on coal-fired generation. Because the Mountain Census Division relies on less expensive hydroelectric generation, the average revenue per kilowatthour in this region is usually below the national average for all classes of consumers. The Census divisions where Federal hydroelectric facilities provide significant amounts of electricity, such as the East South Central Census Division, also have lower than average revenue per kilowatthour.

Tables 11 through 13 contain summary statistics on the average revenue per kilowatthour of electricity sold at the national, Census division, and State level by sector and class of utility ownership. Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are not included in the summary statistics.

Figure 13. Average Revenue per Kilowatthour for the Residential Sector by State, 1991

Residential Average Revenue per kWh is 8.0 Cents

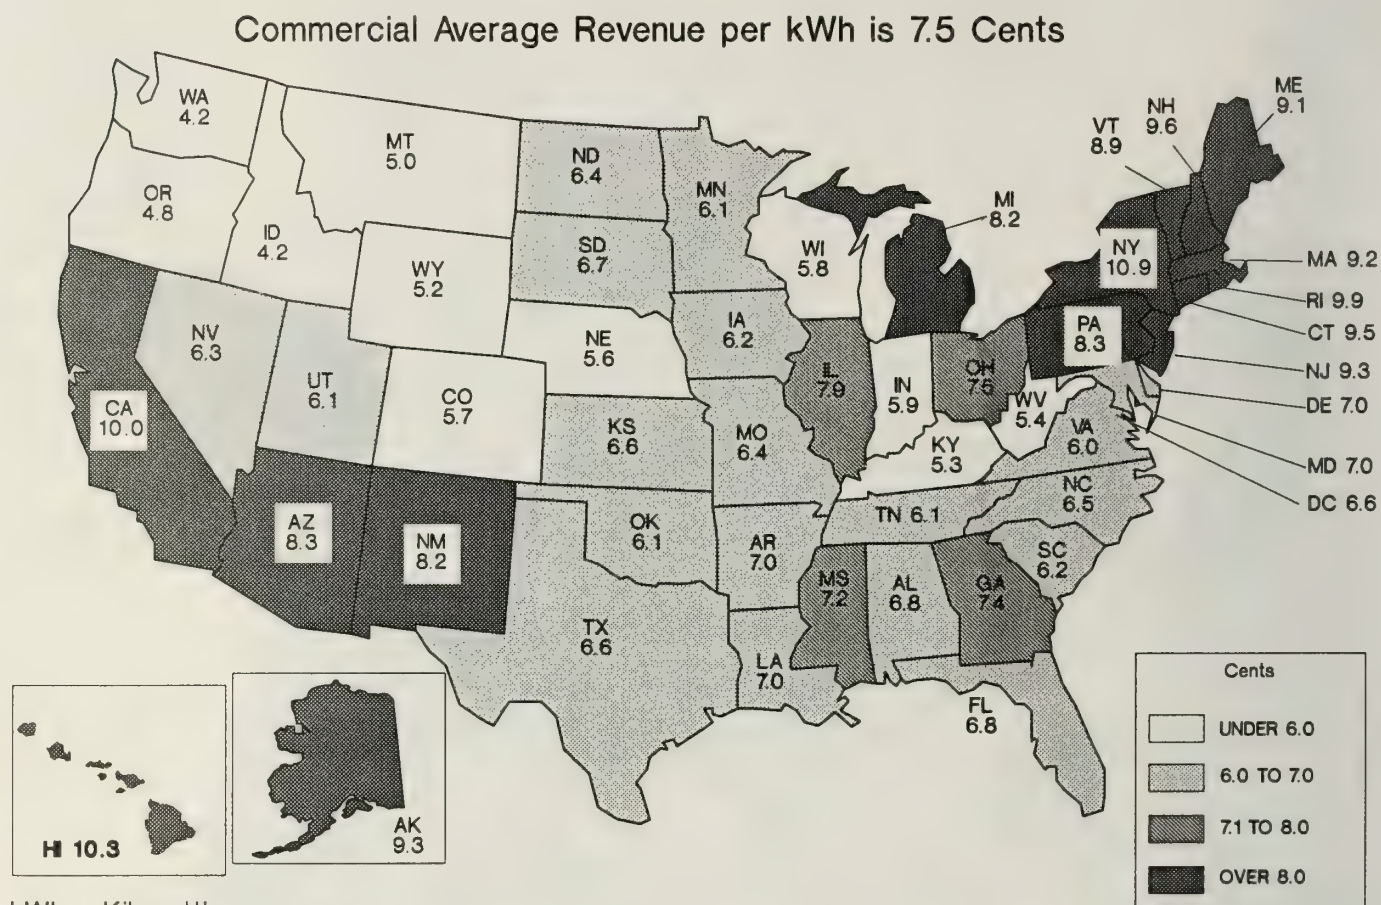

kWh = Kilowatthour.

Note: The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

Notes: •The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales. •The Form EIA-861 data shown in this publication differ somewhat from Form EIA-826, "Monthly Electric Utility Sales and Revenue Report with State Distributions," estimated data published in the *Electric Power Monthly* and in the *Electric Power Annual* for 1987 and prior years. See Appendix B for a detailed description of these differences.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

Average Revenue per Kilowatthour at the Electric Utility Level

The average revenue per kilowatthour of electricity sold for each utility is calculated in this report by dividing the total annual revenue of the electric utility by its total annual sales of electricity across all sectors. Because the average revenue per kilowatthour varies between sectors, the difference in average revenue per kilowatthour between utilities may represent a difference in their proportion of sales in the different sectors. Accordingly, the average revenue for a given utility does not reflect the differences that may exist in its revenue structure across sectors. The average revenue per kilowatthour at the utility level is usually between 4 and 12 cents per kilowatthour but the average may be larger or smaller for a particular sector, ownership type, or State.

Cooperative electric utilities are owned by their members and are established to provide electricity to those members. These electric utilities operate in rural areas with a lower concentration of consumers because these areas were historically viewed as uneconomical operations for investor-owned electric utilities. Cooperative electric utilities generally have broader service areas with smaller consumer bases than other ownership types and, as a consequence, they tend to have higher average revenue per kilowatthour. Cooperative electric utilities that serve consumers in multiple States tend to have even broader service areas and higher

average revenue per kilowatthour. Because of these characteristics, the average revenue per kilowatthour for the majority of cooperative electric utilities is not provided in Tables 14 through 17 as they reported either less than \$100,000 of revenue or less than 1 million kilowatthours of sales.

For example, the Columbus Electric Cooperative, Incorporated, in New Mexico serves consumers in New Mexico as well as in Arizona. The residential average revenue per kilowatthour in Table 14 is 13.4 cents in New Mexico and 12.5 cents in Arizona. The commercial average revenue per kilowatthour in Table 15 is 11.8 cents for New Mexico. The commercial average revenue per kilowatthour is not provided for Arizona because the electric utility reported either less than \$100,000 of revenue or 1 million kilowatthours of sales in this State.

Federal electric utilities generally have the lowest average revenue per kilowatthour for the ownership classes because they have access to relatively low-cost financing and primarily utilize less expensive hydroelectric facilities. The Department of Energy, Western Area Power Administration (WAPA) serves residential consumers in California and Colorado (Table 14) and commercial consumers in Montana (Table 15); because WAPA reported either less than \$100,000 of revenue or 1 million kilowatthours of sales, the average revenue per kilowatthour is not provided in these tables.

Around-the-clock operation is required in order that electric utilities may satisfy the needs of consumers of electricity.

Of the 83 reporting electric utilities in Alaska, 81 utilities have average revenue per kilowatthour exceeding the U.S. average. This occurs in part due to the lack of economies of scale in Alaska and because of the high costs associated with generation and distribution. The electric utilities that have higher costs charge higher rates for electricity that are designed to recover these costs from their consumers. The Power Cost Equalization (PCE) subsidy by the State of Alaska was initially designed to compensate consumers served by electric utilities located in rural areas where transmission access is limited and generating with expensive diesel gas turbines. The Alaska Energy Authority (AEA) administers the subsidy with funds from a State statute since Alaska has no State income tax. Electric utilities qualifying for the PCE program are required to notify consumers of the cost of electric service and the cost minus the State equalization. Consumers receiving the subsidy do not actually pay the high rates. The subsidy is allocated to electric utilities based on consumer sector and demand for electricity within each sector. In Tables 14 through 17, the PCE subsidy has not been subtracted from the total revenue of those electric utilities receiving compensation for high energy costs.

Electric utilities operating on islands with high seasonal populations also tend to have much higher average revenue per kilowatthour. Higher demand charges are needed to recover the fixed equipment and operating costs associated with generating electricity at infrequent times. These electric utilities are few and are primarily located on the East Coast and in the Great Lakes area.

Data on the number of consumers, revenue, sales, and average revenue per kilowatthour for individual electric utilities are contained in Tables 14 through 17. The average revenue per kilowatthour presented in Tables 14 through 17 are based on an average for each of the end-use sectors. When an electric utility provided service to ultimate consumers in more than one State, that utility is listed under each State it serviced. The electric utilities in Table 14 through 17 that provided service to ultimate consumers in more than one State and their percent of sales in each State are shown in Appendix A. Tables 14 through 16 contain the respective consumers, sales, revenue, and average revenue per kilowatthour by each sector for all electric utilities. Table 17 contains the respective sales, revenue, and average revenue for the sum of all sectors. This includes the residential, commercial, and industrial sectors, as well as public street and highway lighting, interdepartmental sales, sales to railroads and railways, and sales to other public authorities.

Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of these data are not sufficient to make the ratio meaningful. See Appendix B for further information.

Data Sources. Statistics contained in Tables 11 through 17 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are included only in Tables 14 through 17, and not in the summary statistics.

¹ The number of ultimate consumers is an average of the number of consumers at the close of each month. Duplicate reporting resulted for the number of consumers for all classes of electric service, of approximately 71,000 consumers in Colorado and 65,000 consumers in Kansas. This resulted from the sale of electric facilities and operations in those states by Centel Corporation to UtiliCorp United, Inc. effective on September 30, 1991. Revenue and megawatthour sales were not duplicated.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

¹ The number of ultimate consumers is an average of the number of consumers at the close of each month. Duplicate reporting resulted for the number of consumers for all classes of electric service, of approximately 71,000 consumers in Colorado and 65,000 consumers in Kansas. This resulted from the sale of electric facilities and operations in those states by Centel Corporation to UtiliCorp United, Inc. effective on September 30, 1991. Revenue and megawatthour sales were not duplicated.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

¹ The number of ultimate consumers is an average of the number of consumers at the close of each month. Duplicate reporting resulted for the number of consumers for all classes of electric service, of approximately 71,000 consumers in Colorado and 65,000 consumers in Kansas. This resulted from the sale of electric facilities and operations in those states by Centel Corporation to UtiliCorp United, Inc. effective on September 30, 1991. Revenue and megawatthour sales were not duplicated.

² The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

¹ The number of ultimate consumers is the sum across all sectors of the average number of consumers at the close of each month. Duplicate reporting resulted for the number of consumers for all classes of electric service, of approximately 71,000 consumers in Colorado and 65,000 consumers in Kansas. This resulted from the sale of electric facilities and operations in those states by Centel Corporation to UtiliCorp United, Inc. effective on September 30, 1991. Revenue and megawatt-hour sales were not duplicated.

² The average revenue per kilowatt-hour of electricity sold is calculated by dividing revenue by sales.

³ Most electric utilities in the State of Alaska that have average revenue per kilowatt-hour exceeding the U.S. average compensate their rural consumers through the State of Alaska, Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatt-hours. Average revenue per kilowatt-hour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatt-hours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Note: Electric utilities serving consumers in more than one State are listed under each State served.

Appendix A

Electric Utilities Serving Ultimate Consumers in More Than One State

This appendix contains information from the Form EIA-861, "Annual Electric Utility Report," regarding electric utilities that serve ultimate consumers in more than one State (Table A1). Additionally, the percent of sales of electricity in each State is included in Table A1. The information can be used as a reference to Tables 14 through 17. For example, information contained in Table A1 indicates that the Appalachian Power Company serves consumers in the States of Virginia and West Virginia. Tables 14 through 17 contain the

respective sales, revenue, and average revenue by each sector and for all sectors for this electric utility in both States. The majority of utilities that serve ultimate consumers in more than one State are the investor-owned electric utilities. These electric utilities generally have large franchise service areas and historically have served in more than one State. Publicly owned electric utilities usually are chartered by municipal or State governments and usually provide service within the cities or counties where they are located.

Appendix B

Technical Notes

Appendix B

Technical Notes

Sources of Data

The *Electric Sales and Revenue (ESR)* is prepared by the Survey Management Division, Office of Coal, Nuclear, Electric and Alternate Fuels (CNEAF), Energy Information Administration (EIA), U.S. Department of Energy. Data published in the *ESR* are compiled from the EIA statistical Form EIA-861, "Annual Electric Utility Report." A brief summary of the form is presented below.

Form EIA-861

The Form EIA-861 is a mandatory census of electric utilities in the United States. The survey is used to collect information on power production and sales data from approximately 3,250 electric utilities. The data collected are used to maintain and update the electric utility frame data base of the EIA. This data base supports queries from the Executive Branch, Congress, other public agencies, and the general public. Summary data from the Form EIA-861 are also contained in the *Electric Power Monthly*, the *Electric Power Annual*, the *Financial Statistics of Selected Investor-Owned Electric Utilities*, the *Financial Statistics of Selected Publicly Owned Electric Utilities*, and the *Annual Outlook for U.S. Electric Power*. These reports present aggregate totals for electric utilities at the national, regional, and State level by consumer classes. Data for the four power authorities of the Virgin Islands, American Samoa, Guam, and Puerto Rico are included only in the detailed tables, and not in the summary statistics.

Instrument and Design History. The Form EIA-861 was implemented in January 1985 to collect data as of year-end 1984. The Federal Energy Administration Act of 1974 (Public Law 93-275) defines the legislative authority to collect these data.

Data Processing. The Form EIA-861 is mailed to the respondents in January to collect data as of the end of the preceding calendar year. The completed forms are to be returned to the EIA by April 1. These data are manually edited before being entered into the interactive on-line system. Internal edit checks are performed to verify that current data total across and between schedules, and are comparable to data reported the

previous year. Edit checks are also performed to compare data reported on the Form EIA-861 with similar data reported on the Forms EIA-826, EIA-412, and Federal Energy Regulatory Commission Form 1. Respondents are contacted by telephone to obtain clarification of reported data or to obtain missing data.

Form EIA-861 figures shown in this publication differ somewhat from the sum of the monthly Form EIA-826 figures for sales published in the *Electric Power Monthly* and in issues of the *Electric Power Annual* prior to 1988. Both forms use sectoral classifications (residential, commercial, and industrial) based on the usual classification of consumers by the electric utilities. At the national level, the Form EIA-861 and Form EIA-826 figures corresponded closely (within 3 percent) for all end-use sectors. Some larger differences were observed at the State level particularly for Tennessee due to inconsistent classification of commercial and industrial data between the Form EIA-826 and the Form EIA-861 surveys.

Differences between the Form EIA-861 and Form EIA-826 figures can result from the Form EIA-826 sampling procedure and/or from nonsampling error in either data collection. One source of nonsampling error in the Form EIA-826 stems from the practice of filing estimates for monthly sales and revenue when the actual figures are not yet available. Although respondents are instructed to file revisions, revisions are not always filed. The respondents are instructed to review their Form EIA-826 figures at the end of the reporting year to ensure consistency with Form EIA-861 figures. Survey analysts at the EIA compare these data series and attempt to resolve any differences. Nevertheless, some reporting differences remain.

Electric revenue and sales data are rounded and reported by electric utilities in thousand dollars and thousand kilowatthours. For this publication the average revenue per unit cost of electricity sold is calculated by dividing total electric revenue by the total sales of electricity. For Tables 14 through 17 the average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Quality of Data

The CNEAF office is responsible for routine data improvement and quality assurance activities. All operations in this office are done in accordance with formal standards established by the EIA. These standards are the measuring rod necessary for quality statistics. Data improvement efforts include verification of data-keyed input by automatic computerized methods, editing by subject matter specialists, and followup on nonrespondents. The CNEAF office supports the quality assurance efforts of the data collectors by providing advisory reviews of the structure of information requirements and of proposed designs for new and revised data collection forms and systems. Once implemented, the actual performance of working data collection systems is also validated. Computerized respondent data files are checked to identify those who fail to respond to the survey. By law, nonrespondents may be fined or otherwise penalized for not filing a mandatory EIA data form. Before invoking the law, the EIA tries to obtain the required information by encouraging cooperation of nonrespondents.

Completed forms received by the CNEAF office are sorted, screened for completeness of reported information, and keyed onto computer tapes for storage and transfer to random access data bases for computer processing. The information coded on the computer tapes is manually spot-checked against the forms to certify accuracy of the tapes. To ensure the quality standards established by the EIA, formulas that use the past history of data values in the data base have been designed and implemented to automatically check data input for errors. Data values that fall outside the ranges prescribed in the formulas are verified by telephoning respondents to resolve any discrepancies.

Data Editing System

Data from the Form EIA-861 are edited on an annual basis using automated systems. The edits include both deterministic checks, in which records are checked for the presence of required fields and their validity, and statistical checks, in which estimation techniques are used to validate data according to their behavior in the past and in comparison to other current fields.

Confidentiality of the Data

The data collected on the forms used for input to this report are not confidential.

Formulas

Average Revenue per Kilowatthour. The average revenue per unit cost of electricity sold is calculated by dividing total annual revenue by total annual sales of electricity.

Calculation Effects of Average Revenue Per Kilowatthour and Sales on Revenue.

Δr = Change in average revenue from $year_1$ to $year_2 = r_2 - r_1$

ΔS = Change in sales from $year_1$ to $year_2 = S_2 - S_1$

ΔR = Change in revenue from $year_1$ to $year_2 = R_2 - R_1$

$\Delta R = (S_2)\Delta r + (r_1)\Delta S$

Effect of change in average revenue on change in

$$\text{revenue} = \frac{(S_2)\Delta R}{(S_2)\Delta r + (r_1)\Delta S} * 100 \%$$

$$\text{Effect of change in sales on change in revenue} = \frac{(r_1)\Delta S}{(S_2)\Delta r + (r_1)\Delta S} * 100 \%$$

Rounding Rules for Data

Given a number with r digits to the left of the decimal and $d+t$ digits in the fraction part, with d being the place to which the number is to be rounded and t being the remaining digits that will be truncated, this number is rounded to $r+d$ digits by adding 5 to the $(r+d+1)$ th digit when the number is positive or by subtracting 5 when the number is negative. The t digits are then truncated at the $(r+d+1)$ th digit. The symbol for a rounded number truncated to zero is (*).

Data Correction Procedure

The CNEAF office has adopted the following policy with respect to the revision and correction of the Form EIA-861 data published in this report and made available in a machine format:

- Publication of these data results in their finalization at which point the data base is closed.
- Revisions or corrections are made only in the event a substantial (greater than 1 percent) reporting change is received or a substantial (greater than 1 percent) error is discovered.
- No revisions will be made without the approval of the Director, Survey Management Division.

Table B1. Unit-of-Measure Equivalents for Electricity

Unit	Equivalent		
Kilowatt (kW)	1,000	(One Thousand)	Watts
Megawatt (MW)	1,000,000	(One Million)	Watts
Gigawatt (GW)	1,000,000,000	(One Billion)	Watts
Terawatt (TW)	1,000,000,000,000	(One Trillion)	Watts
Gigawatt	1,000,000	(One Million)	Kilowatts
Thousand Gigawatts	1,000,000,000	(One Billion)	Kilowatts
Kilowatthours (kWh)	1,000	(One Thousand)	Watthours
Megawatthours (MWh)	1,000,000	(One Million)	Watthours
Gigawatthours (GWh)	1,000,000,000	(One Billion)	Watthours
Terawatthours (TWh)	1,000,000,000,000	(One Trillion)	Watthours
Gigawatthours	1,000,000	(One Million)	Kilowatthours
Thousand Gigawatthours	1,000,000,000	(One Billion)	Kilowatthours

Obtaining Copies of Data or the Form

Upon EIA approval of the *Electric Sales and Revenue*, the data become available for public use on a cost-recovery basis. Computer listings may be obtained by submitting a written request to:

Energy Information Administration, EI-521
Forrestal Building
U.S. Department of Energy
Washington, DC 20585

These data are also available on machine-readable tapes. Tapes may be purchased by using Visa, Master Card, or American Express cards, as well as money orders or checks payable to the National Technical Information Service (NTIS). Purchasers may also use NTIS and Government Printing Office depository ac-

counts. To place an order, contact:

National Technical Information Service (NTIS)
Office of Data Base Services
U.S. Department of Commerce
5285 Port Royal Road
Springfield, Virginia 22161
(703) 487-4650

Copies of the form and its instructions may be obtained from the National Energy Information Center (NEIC). The address and telephone number appear below.

National Energy Information Center, EI-231
Energy Information Administration
Forrestal Building, Room 1F-048

Glossary

Base Bill: A charge calculated by taking the rate from the appropriate electric rate schedule and applying it to the level of consumption.

Base Rate: A fixed per kilowatthour charge for electricity consumed that is independent of other charges and/or adjustments.

Block Rate Schedule: An electric rate schedule with a provision for charging a different unit cost for various increasing blocks of demand or energy. Usually a reduced price is charged on succeeding blocks.

Census Divisions: The nine geographic divisions of the United States established by the Bureau of the Census, U.S. Department of Commerce for statistical analysis. The boundaries of Census divisions coincide with State boundaries. The Pacific Division is subdivided into the Pacific Contiguous and Pacific Noncontiguous areas.

Classes of Service: Consumers grouped by similar characteristics in order to be identified for the purpose of setting a common rate for electric service. Usually classified into groups identified as residential, commercial, industrial and other.

Class Rate Schedule: An electric rate schedule applicable to one or more specified classes of service, groups of businesses, or customer uses.

Commercial Sector: The commercial sector is generally defined as nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, and health, social, and educational institutions. Electric utilities may classify commercial service as service that includes all consumers whose demand or annual use exceeds some specified limit. The limit may be set by the utility based on the rate schedule of the utility. Consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifica-

tions, should be classified based on the schedule they most closely resemble. If there is no rate schedule distinction, utilities may define commercial consumers as those having a demand of less than 1000 kilowatts.

Consumer Charge: An amount charged periodically to a consumer for such utility costs as billing and meter reading, without regard to demand or energy consumption.

Cooperative Electric Utility: A group organized under the law into a utility company that will generate, transmit, and/or distribute supplies of electric energy to a specified area not being serviced by another utility. Such ventures are generally exempt from the Federal income tax laws. Most electric cooperatives have initially been financed by the Rural Electrification Administration, U.S. Department of Agriculture.

Cost of Service: A ratemaking concept used for the design and development of rate schedules to ensure that the filed rate schedules recover only the cost of providing the electric service at issue. These costs include operating and maintenance expenses, depreciation and amortization expenses, and income and other taxes found just and reasonable by the regulatory agency for ratemaking purposes plus, in the case of privately owned electric utilities, an allowance for a return on capital (usually computed by applying a rate of return to the rate base). This concept attempts to equate the cost incurred by the utility to the revenue received for the service provided to each of the consumer classes.

Demand (Electric): The rate at which electric energy is delivered to or by a system, part of a system, or piece of equipment, at a given instant or averaged over any designated period of time.

Demand Charge: That portion of the consumer's bill for electric service based on the consumer's maximum electric capacity usage and calculated based on the

billing demand charges under the applicable rate schedule.

Energy Information Administration (EIA): An independent agency within the U.S. Department of Energy that develops surveys, collects energy data, and does analytical and modeling analysis of energy issues. The Agency must meet the requests of Congress, other elements within the Department of Energy, Federal Energy Regulatory Commission, the Executive Branch, its own independent needs, and assist the general public, or other interest groups, without taking a policy position.

Economy of Scale: The principle that larger production facilities have lower unit costs than smaller facilities.

Electric Power Industry: The privately, publicly, federally and cooperatively owned electric utilities of the United States taken as a whole. This includes all electric systems serving the public: regulated investor-owned electric utility companies; Federal power projects; State, municipal, and other government-owned systems, including electric public utility districts; electric cooperatives, including generation and transmission entities. Excluded from this definition are the special purpose electric facilities or systems that do not offer service to the public.

Electric Rate: The price set for a specified amount of electricity in an electric rate schedule or sales contract.

Electric Rate Schedule: A statement of the electric rate and the terms and conditions governing its application, including attendant contract terms and conditions that have been accepted by a regulatory body with appropriate oversight authority.

Electric Utility: An enterprise that is engaged in the generation, transmission, or distribution of electric energy primarily for use by the public and that is the major power supplier within a designated service area. Electric utilities include privately owned, publicly owned, cooperatively owned, and government-owned (municipals, Federal agencies, State projects, and public power districts) systems.

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic en-

ergy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Federal Energy Regulatory Commission (FERC): A quasi-independent regulatory agency within the Department of Energy having jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification.

Flat and Meter Rate Schedule: An electric rate schedule consisting of two components, the first of which is a service charge, and the second a price for the energy consumed.

Flat Demand Rate Schedule: An electric rate schedule based on billing demand that provides no charge for energy.

Gigawatt (GW): One billion watts.

Gigawatthour (GWh): One billion watthours.

Industrial Sector: The industrial sector is generally defined as including manufacturing, construction, mining, agriculture, fishing, and forestry establishments under Standard Industrial Classification (SIC) codes 01-39. The utility may classify industrial service using the SIC codes, or based on demand or annual usage exceeding some specified limit. The limit may be set by the utility based on its own rate schedule. Sales for consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifications, should be classified based on the classification of their rate most closely resembles. If there is no rate schedule distinction, utilities may define industrial consumers as those having a demand equal to or greater than 1,000 kilowatts.

Interdepartmental Sales: Includes amounts charged by the electric department at tariff or other specified rates for electricity supplied by it to other utility departments.

Investor-Owned Electric Utility: A class of utility that is investor owned and organized as a tax paying business, usually financed by the sales of securities in the capital market.

Kilowatt (kW): One thousand watts.

Kilowatthour (kWh): One thousand watthours.

Megawatt (MW): One million watts.

Megawatthour (MWh): One million watthours.

Other Sector: Electricity supplied to public street and highway lighting, other service to public authorities, service to railroads and and railways, and interdepartmental service.

Power (Electrical): An electric measurement unit of power called a voltampere is equal to the product of 1 volt and 1 ampere. This is equivalent to 1 Watt for a direct current system and a unit of apparent power is separated into real and reactive power. Real power is the work-producing part of apparent power that measures the rate of supply of energy and is denoted as kilowatts (KW). Reactive power is the portion of apparent power that does no work and is referred to as kilovars; this type of power must be supplied to most types of magnetic equipment, such as motors, and is supplied by generator or by electrostatic equipment. Voltamperes are usually divided by 1,000 and called kilovoltamperes (kVA). Energy is denoted by the product of real power and the length of time utilized; this product is expressed as kilowatthours.

Public Authorities: Electricity supplied to municipalities or divisions or agencies of State and Federal governments, usually under special contracts or agreements that are applicable only to public authorities.

Public Street and Highway Lighting Service: Electricity supplied and services rendered for the purpose of lighting streets, highways, parks, and other public places; or for traffic or other signal system service, for municipalities, or other divisions or agencies of State or Federal governments.

Publicly Owned Electric Utility: A class of utility that includes those utilities operated by municipalities, po-

litical subdivisions, utility or power districts, and State and Federal power agencies.

Railroad and Railway Electric Service: Electricity supplied to railroads and interurban and street railways, for general railroad use, including the propulsion of cars or locomotives, where such electricity is supplied under separate and distinct rate schedules.

Rate Base: The value of property upon which a utility is permitted to earn a specified rate of return as established by a regulatory authority. The rate base generally represents the value of property used by the utility in providing service and may be calculated by any one or a combination of the following accounting methods: fair value, prudent investment, reproduction cost, or original cost. Depending on which method is used, the rate base includes cash, working capital, materials and supplies, and deductions for accumulated provisions for depreciation, contributions in aid of construction, customer advances for construction, accumulated deferred income taxes, and accumulated deferred investment tax credits.

Residential Sector: The residential sector includes private household establishments that consume energy primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. The classification of an individual consumer's account, where the use is both residential and commercial, is based on principal use. Apartment houses are included.

Retail: Sales covering electrical energy supplied for residential, commercial, and industrial end-use purposes. Other small classes, such as agriculture and street lighting, also are included in this category.

Rural Electrification Administration (REA): A lending agency of the U.S. Department of Agriculture, the REA makes self-liquidation loans to qualified borrowers to finance electric and telephone service to rural areas. The REA also finances the construction and operation of generating plants, electric transmission and distribution lines, or systems for the furnishing of initial and continued adequate electric services to persons in rural areas not receiving central station service.

Sales: The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. Other sales include public street and highway lighting,

other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Schedule: A statement of the pricing format of electricity and the terms and conditions governing its applications.

Seasonal Rates: Different seasons of the year are structured into an electric rate schedule whereby an electric utility provides service to consumers at different rates. The electric rate schedule usually takes into account demand based on weather and other factors.

Special Contract Rate Schedule: An electric rate schedule for an electric service agreement between a utility and another party in addition to, or independent of, any standard rate schedule.

Special Purpose Rate Schedule: An electric rate schedule limited in its application to some particular purpose

or process within one, or more than one, type of industry or business.

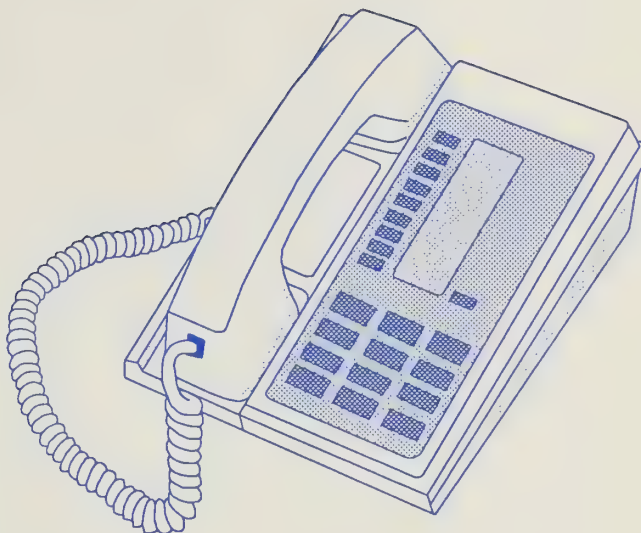

Tariff: A published volume of rate schedules and general terms and conditions under which a product or service will be supplied.

Time-of-Day Rate: The rate charged by an electric utility for service to various classes of customers. The rate reflects the different costs of providing the service at different times of the day.

Watt: The electrical unit of power. The rate of energy transfer equivalent to 1 ampere flowing under a pressure of 1 volt at unity power factor.

Watthour (Wh): An electrical energy unit of measure equal to 1 watt of power supplied to, or taken from, an electric circuit steadily for 1 hour.

Preface

The *Electric Sales and Revenue* is prepared by the Survey Management Division, Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA); U.S. Department of Energy. This publication provides information about sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to residential, commercial, industrial, and other consumers throughout the United States. Previous publications presented data on typical electric bills at specified consumption levels as well as sales, revenue, and average revenue.

The sales, revenue, and average revenue per kilowatthour provided in the *Electric Sales and Revenue* are based on annual data reported by electric utilities for the calendar year ending December 31, 1992. The electric revenue reported by each electric utility includes the applicable revenue from kilowatthours sold; revenue from income; unemployment and other State and local taxes; energy, demand, and consumer service charges; environmental surcharges; franchise fees; fuel adjustments; and other miscellaneous charges. The revenue does not include taxes, such as sales and excise taxes, that are assessed on the consumer and collected through the utility. Average revenue per kilowatthour is defined as the cost per unit of electricity sold and is calculated by dividing retail sales into the associated electric revenue. The sales of electricity, associated revenue, and average revenue per kilowatthour provided in this report are presented at the national, Census division, State, and electric utility levels.

Target Audience

In the private sector, users of the *Electric Sales and Revenue* include researchers, analysts, and ultimately the policy- and decision-making members of electric utility companies. Other users include financial and investment institutions, economic development organizations, special interest groups, lobbyists, electric power associations, and the news media.

In the public sector, the users include analysts, researchers, statisticians, and other professionals engaged in regulatory, policy, and program areas for Federal, State, and local governments. The Congress and other legislative bodies will also be interested in general trends related to electricity at State and national levels. Data in this report can be used in analytic studies to evaluate new legislation and regulatory alternatives, and to forecast future demand for electric power. Public service commissions and other special government groups share an interest in State-level statistics. These groups can compare the statistics for their States with those of other jurisdictions.

Coverage of Sources

Data published in the *Electric Sales and Revenue* are compiled from the Form EIA-861, "Annual Electric Utility Report." A brief description of the form follows. The form is described in more detail in Appendix B, "Technical Notes." Copies of the form and its instructions may be obtained from the National Energy Information Center (NEIC).

The Form EIA-861 is a census of electric utilities in the United States, its territories, and Puerto Rico. The form is used to collect information on the production and sale of electricity from approximately 3,250 electric utilities (Figure 1). This publication presents data on the number of consumers, sales, and revenue reported on the Form EIA-861. Average revenue per kilowatthour presented in this publication are calculated by dividing sales into revenue. Since electric rates vary based on energy usage, average revenue per kilowatthour are affected by changes in the volume of sales.

Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are included in Table 14 through Table 17, and not in the national, Census division, and State level statistics.

Profile

This chapter contains two sections. The "Background" section provides a discussion on 1) sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to ultimate consumers; 2) the classes of electric utility ownership; and 3) the classes of service or sectors. The "Year at a Glance" section provides a summary of pertinent statistics during the year related to sales of electricity, associated revenue, and average revenue per kilowatthour.

Background

Sales, Revenue, and Average Revenue per Kilowatt-hour. Electric power is an integral part of our way of life. It is indispensable to the factory, the commercial establishment, the home, and even most recreational facilities. The unavailability of electric power causes inconvenience to customers as well as the economic loss due to reduced industrial production. Electric companies are responsible for ensuring an adequate and reliable source of electricity to all consumers in their service territories at a reasonable cost.

The service territory of an electric utility is geographically distinct and is usually composed of many different combinations of consumers. Electric utilities classify their consumers by different factors, such as level of electrical demand, rate schedule, Standard Industrial Classification (SIC) code, distribution voltage, accounting methods, end-use applications, and other social and economic characteristics. Electric utilities use consumer classifications for planning (load growth, peak demands) and for determining their sales and revenue requirements (cost of service), from which they derive their rates.

Average revenue per kilowatthour is defined as the cost per unit of electricity sold and is calculated by dividing retail electric revenue by the corresponding sales of electricity. The average revenue per kilowatthour is calculated for all consumers and for each sector (residential, commercial, industrial, and other sales). The average revenue per kilowatthour represents an average of all consumption levels and rates. The electric revenue used to derive the average revenue per kilowatthour is the operating revenue reported by the electric utility. Operating revenue includes energy charges, demand charges, consumer service charges, environmental surcharges, fuel adjustments, other miscellaneous charges, and State and local

taxes. State and local taxes are collected by the electric utility as part of their billing process but are expensed and passed along to the appropriate taxing authority.

Average revenue per kilowatthour is affected by changes in the rate schedules used by the electric utilities and by changes in the volume of electricity sales. Because fixed charges remain constant regardless of the volume of sales, average revenue per kilowatthour will decrease as the volume of sales increases. A change in average revenue per kilowatthour may occur when the volume of electricity sales changes (because of an increase/decrease in the use of electricity by the individual consumer or an increase/decrease in the number of ultimate consumers) across all sectors or within a specific sector. Generally, the rate schedules used by electric utilities are designed so that revenue increases more slowly as the volume of sales increases, lowering the average revenue per kilowatthour. The net effect of these trends on the average revenue per kilowatthour presented in this publication has not been determined. Average revenue per kilowatthour is in part impacted by class of utility ownership and by class of service (sector). Consequently, data in this publication are presented by class of ownership and sector.

Classes of Ownership. The electric power industry in the United States is a combination of approximately 3,250 investor-owned, publicly owned, Federal, and cooperative electric utilities. Historically, investor-owned electric utilities have been most successful in serving large, consolidated markets where economies-of-scale afforded the lowest prices. However, publicly owned, Federal, and cooperative electric utilities all have a role in producing, transmitting, and distributing electricity.

Like all private businesses, the fundamental objective of an investor-owned utility is to produce a return for its investors. The investor-owned electric utility either distributes its profits to stockholders as dividends or reinvests these profits. It is granted a service monopoly in certain geographic areas and is obliged to serve all consumers. As franchised monopolies, these utilities are regulated and required to charge reasonable prices, to charge comparable prices to similar classifications of consumers, and to give consumers access to services under similar conditions. Most investor-owned electric utilities are operating companies that provide basic services for the generation, transmission, or distribution of electricity. The majority of investor-owned utilities

LIBRARY U. OF I. LIBRARY

perform all three functions. There are approximately 270 investor-owned electric utilities operating in all States except Nebraska. The electric utilities in Nebraska consist primarily of municipal systems and public power districts. In Hawaii electricity generation is supplied by investor-owned electric utilities or nonutility power producers such as Lihue Plantation. Investor-owned electric utilities currently account for more than 70 percent of all electric utility generating capability, generation, sales, and revenue in the United States.

Publicly owned electric utilities are nonprofit local government agencies established to provide service to their communities and nearby consumers at cost, returning excess funds to the consumer in the form of community contributions, more economic and efficient facilities, and lower rates. Publicly owned electric utilities (which number approximately 2,000) include municipals, public power districts, State authorities, irrigation districts, and other State organizations. Most municipal utilities simply distribute power, although some larger ones produce and transmit electricity as well. They obtain their financing from municipal treasuries and from revenue bonds secured by proceeds from the sale of electricity. Public power districts and projects are concentrated in Nebraska (which has no investor-owned electric utilities), Washington, Oregon, Arizona, and California. Voters in a public utility district (PUD) elect commissioners or directors to govern the district independent of any municipal government. State authorities, like the Power Authority of the State of New York or the South Carolina Public Service Authority, are agencies of their respective State government. Irrigation districts may have still other forms of organization. In the Salt River Project, votes for the board of directors are apportioned according to the size of landholdings.

Cooperative electric utilities are owned by their members and are established to provide electricity to those members. These electric utilities operate in rural areas with a lower concentration of consumers because these areas were historically viewed as uneconomical operations for investor-owned electric utilities. They are incorporated under State law and are usually directed by an elected board of directors, which in turn selects a manager. The Rural Electrification Administration, the National Rural Utilities Cooperative Finance Corporation, the Federal Financing Bank, and the Bank for Cooperatives are the most important sources of debt financing for electric cooperatives. There are approximately 950 electric cooperatives currently doing business in 47 States. Cooperative electric utilities do

not operate in Connecticut, Hawaii, and Rhode Island, or in the District of Columbia.

There are 10 Federal electric utilities in the United States. They are the Department of Defense-U.S. Army Corps of Engineers; the Department of Energy-Alaska, Bonneville, Southeastern, Southwestern, and Western Area Power Administrations; the Department of Interior-U.S. Bureau of Indian Affairs and the U.S. Bureau of Reclamation; the Department of State-International Boundary and Water Commission; and the Tennessee Valley Authority. The Federal electric utilities are primarily generators and wholesalers of electricity rather than distributors to ultimate consumers. Federal electric utilities operate approximately 180 power plants and produce almost 9 percent of the electricity generated in the United States. Most of the power plants are Federal hydroelectric projects initially designed for flood control and irrigation purposes. Federal power is not sold for profit, but to recover the cost of operations. Most Federal generation is sold for resale to municipals, cooperative electric utilities, and other nonprofit preference customers, as required by law. Three Federal agencies operate Federal generating facilities: the Tennessee Valley Authority (TVA), the largest Federal producer; the U.S. Army Corps of Engineers (USCE); and the U.S. Bureau of Reclamation (USBR). The TVA markets its own power while the generation by the USCE, except for the North Central Division (St. Mary's Falls at Sault St. Marie, Michigan), and the USBR is marketed by four of the Federal power marketing administrations (PMA): Bonneville, Southeastern, Southwestern, and Western Area. The four PMA's also purchase energy for resale from other electric utilities in the United States and Canada. Alaska, the fifth PMA, operates its own power plants and distributes power to ultimate consumers. The majority of electricity generated by Federal electric utilities is sold for resale, not to ultimate consumers.

Classes of Service (Sectors). In general, electricity consumers are divided into classes or sectors based on the type of service they receive. The categorization of ultimate consumers is determined by each electric utility (*residential, commercial, and industrial*) based on the type of service consumers receive that reflect the maximum electric demand and energy consumption anticipated.

The residential sector includes electricity supplied to private household establishments and apartment buildings where energy is consumed primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying.

The commercial sector includes electricity supplied to nonmanufacturing business establishments and sometimes small manufacturing facilities, including hotels, motels, restaurants, wholesale businesses, and retail stores; and health, social, and educational institutions. An electric utility may classify commercial consumers as those consumers whose demand and/or usage exceeds specified limits. The limits are set by the electric utility based on different rate schedules.

The industrial sector includes electricity supplied to manufacturing, construction, mining, agriculture, fishing, and forestry establishments -- Standard Industrial Classification (SIC) codes 1 through 39. An electric utility may classify industrial consumers using these SIC codes, or it may classify industrial consumers based on demand and/or usage exceeding specified limits. As in the commercial sector, the limits are set by the electric utility based on different rate schedules.

Sales to other consumers include public street and highway lighting, railroads and railways, municipalities, divisions or agencies of State and Federal Governments under special contracts or agreements, and other utility departments, as defined by the pertinent regulatory agency and/or electric utility. Sales to these consumers, as well as the residential, commercial, and industrial consumers may be classified differently by each electric utility because of different rates, demand levels, and the economic activities of the consumers.

The Year at a Glance

In 1992, total sales of electricity to ultimate consumers were 2,763 billion kilowatthours and total revenue was \$188 billion (Table 1). Sales to the residential sector in 1992 were 936 billion kilowatthours and revenue was \$77 billion. The nonresidential sector¹ (commercial and industrial sectors) had sales of 1,734 billion kilowatthours, and revenue of \$105 billion. The average revenue per kilowatthour of electricity sold to ultimate consumers in the United States in 1992 was 6.8 cents (Table 2). Average revenue per kilowatthour for the residential and nonresidential sectors was 8.2 and 6.1 cents in 1992, respectively.

Average Revenue by Sector and Type. Because Federal electric utilities have access to relatively low-cost financing and mostly utilize less expensive hydroelectric facilities, they have the lowest average revenue per kilowatthour of all the ownership classes and sectors. The average revenue per kilowatthour of publicly owned electric utilities in the residential sector, at 6.6

cents, was 14 percent below that for cooperative electric utilities at 7.7 cents; and 23 percent below that of investor-owned electric utilities at 8.6 cents, (Table 2). The average revenue per kilowatthour of publicly owned electric utilities in the nonresidential sector, at 6.6 cents, was 11 percent below that for cooperative electric utilities at 7.4 cents and 15 percent below that for investor-owned electric utilities at 7.8 cents.

Sales by Sector. An all time record for total sales of electricity was set in 1992 at 2,763 billion kilowatthours although this was less than a 1-percent increase from 1991. Sales of electricity to the residential sector decreased by 2 percent (19 billion kilowatthours) in 1992. The decrease in residential sales and relatively small growth in the nonresidential sales may be the result of many factors including weather, economic conditions, and energy conservation. Electric utilities reported an energy savings of 32 billion kilowatthours due to utility implemented programs designed to reduce demand, also known as demand-side management.² Sales of electricity to the nonresidential sector increased by slightly more than 1 percent (22 billion kilowatthours) in 1992.

Revenue by Sector. The total revenue from sales of electricity was 1 percent more than in 1991 (Table 3). Revenue increased by less than 0.1 percent for the residential sector in 1992. The small increase in revenue is due to the decrease in sales. The average price of electricity for the residential sector increased by 2.1 percent from 8.04 cents per kilowatthour in 1991 to 8.21 cents per kilowatthour in 1992. Revenue for the nonresidential sector increased by 1.8 percent in 1992. This increase is due to a 1.3 percent increase in sales and a 0.5 percent increase in average price from 6.04 cents per kilowatthour in 1991 to 6.07 cents per kilowatthour in 1992.

Sales by Type of Ownership. Among the ownership classes, investor-owned electric utilities accounted for 76 percent (2,112 billion kilowatthours) of total U.S. sales of electricity in 1992 (Table 4). Publicly owned electric utilities accounted for 14 percent (395 billion kilowatthours); electric cooperative utilities accounted for 7 percent (207 billion kilowatthours); and Federal electric utilities accounted for 2 percent (49 billion kilowatthours), of total U.S. sales in 1992. Investor-owned and publicly owned electric utilities both reported less than a 1-percent increase (2 billion kilowatthours) in 1992 sales to ultimate consumers, compared with 1991. Sales of electricity by cooperative electric utilities increased by 1 percent (2 billion kilowatthours). Federal electric utilities reported an 8-percent decrease (4 billion kilowatthours).

¹Changes for the nonresidential sector are discussed as caution must be used in analyzing year to year changes in the commercial and industrial sectors since electric utilities may have reclassified their consumers between the commercial and industrial sectors.

²Energy Information Administration, Electric Power Annual (EPA), DOE/EIA-0348(92), p. 106.

Revenue by Type of Ownership. All ownership classes reported increases in revenue from sales of electricity in 1992, compared with 1991 except Federal electric utilities. Publicly owned and cooperative electric utilities each reported 2 percent increases. Investor-owned electric utilities reported a 1-percent increase in 1992 revenue, while Federal electric utilities reported a 14-percent decrease. (Table 4).

Average Revenue by Type of Ownership. In 1992, Federal electric utilities continued to have the lowest average revenue per kilowatt-hour at 2.6 cents, a 7-percent decrease from 1991 (Table 11). Federal electric utilities generally have lower average revenue per kilowatt-hour because they are exempt from income tax, have access to lower interest loans, and generate less expensive hydroelectric power. In addition, many Federal hydroelectric projects are multi-purpose projects and only a portion of the costs are allocated to electricity. Average revenue per kilowatt-hour for publicly owned electric utilities was also lower than that of investor-owned electric utilities and cooperative electric utilities. Publicly owned electric utilities have access to low-cost capital and are not allowed to charge

a return for profit. Publicly owned electric utilities had an average revenue per kilowatt-hour of 6.0 cents in 1992.

Investor-owned electric utilities had an average revenue per kilowatt-hour of 7.1 cents in 1992, a 1-percent increase from 1991 (Table 11). Although cooperative electric utilities have access to low-cost loans through the Rural Electrification Administration, they had one of the highest average revenues per kilowatt-hour at 7.0 cents in 1992, a 1-percent increase from 1991. The higher average revenue per kilowatt-hour by this ownership group is at least partly attributable to the high cost of operating in remote rural areas having a low concentration of consumers and providing service to a higher percentage of residential customers than other classes of utilities. The lower load factor of residential customers as compared with other sectors (i.e., commercial and industrial) has an associated higher allocation of demand cost due to a lower utilization of generating equipment. In addition, many cooperatives do not generate electricity but, as full requirement customers of electric utilities with generating facilities must pay requirement demand charges.

Sales and Revenue

This chapter provides a discussion on revenue requirements, the allocation of revenue across sectors, and rate schedules. Also provided are summary statistics on the sale of electricity to ultimate consumers and the associated revenue. This information is provided at the national, Census division, and State level.

Cost of Electricity

The process of determining the cost of electricity generally follows three stages: (1) revenue requirements are determined (2) the revenue requirement is allocated to different classes of service (sectors) and (3) rate schedules for each sector are established.

Revenue Requirements. Revenue requirements are set to reimburse the electric utility for providing electric service. The revenue requirements reflect the anticipated cost of providing services for some period of time in the future, usually a year. Revenue requirements include investment depreciation, expenses for the production, transmission, and distribution systems, as well as sales costs, consumer costs, Federal and other taxes, and administration and general expenses. The revenue requirements also include an allowance for the profit of the electric utility, if applicable.

Allocation of Revenue. The cost of service to particular sectors and the mix of consumers served in the sectors provide guidelines for determining how much of the revenue must be collected from each sector. For example, the cost of service to the residential sector is usually higher than the cost to the commercial or industrial sectors because of the large number of consumers served, amount of distribution lines needed to provide the service, and the low consumption levels. The economic activity or type of business of the ultimate consumer is not necessarily the means by which electric utilities classify their consumers to determine revenue requirements and set rates. Electric utilities, in many instances, determine their revenue requirements and set their rates based on the level of demand and/or consumption of electricity.

The residential sector represents 88 percent of the total number of consumers but only accounts for 34 percent of the total sales of electricity and 41 percent of the revenue from those sales. The industrial sector possesses less than 1 percent of the total number of consumers but accounts for 35 percent of the sales and 25

percent of the revenue. The commercial sector consists of 11 percent of the consumers, accounts for 28 percent of total sales and 31 percent of the revenue. The remaining share of sales is accounted for by the "other" sector, which includes public street and highway lighting, railroads and railways, municipalities, divisions or agencies of State and Federal Governments under special contracts or agreements, and other utility departments, as defined by the pertinent regulatory agency and/or electric utility. Investor-owned electric utilities serve approximately three-fourths of the total number of ultimate consumers. Publicly owned electric utilities and electric cooperatives serve nearly all the remaining ultimate consumers as federally owned electric utilities have very few retail customers and sell almost exclusively to other electric utilities.

Rate Schedules. In general, the rate schedules for electric utilities are designed to reimburse utilities for operation, generation, maintenance, rental fees for equipment, and demand and service charges. Operation, generation, maintenance, and rental fees for equipment are usually fixed charges that are assessed monthly or annually. Demand charges are often fixed, but they can vary with the peak demand of the customer. Energy charges vary with the amount of electric energy delivered to consumers. A more detailed discussion of these charges is contained in the third chapter, "Average Revenue."

The rate schedules developed by electric utilities are unique to each utility. The rates reflect any number of considerations that are important to the economic welfare of the electric utility and may reflect other interests as well, such as residential rates that provide economical service to low-income families. Generally, commercial or industrial billings are determined more by the levels of demand and consumption of electricity than by the type of economic activity in which the consumer is engaged.

For instance, while commercial and industrial consumers are billed according to a particular rate schedule that frequently reflects the type of business indicated by that schedule, there are exceptions. A light manufacturing establishment with a manufacturing process that consumes little energy could be billed at a commercial rate because its consumption is not high enough to fall into the industrial schedule. Conversely, a very large commercial building might have sufficiently large consumption to be billed at the industrial rate.

Sectorial classification of consumers may change over the course of a year as consumption varies. As a result, the rate schedule that would be applicable may vary. For example, a very large commercial building may have a high level of consumption during the summer because of air conditioning equipment and would be billed at industrial rates. However, in the winter, if the building is heated by gas, consumption of electricity may decline and commercial rates may be applied for billing purposes rather than industrial rates.

The authority for the approval of rate schedules is based on the class of utility ownership. Investor-owned electric utilities are regulated by State public service commissions and the Federal Energy Regulatory Commission. Publicly owned and cooperatives electric util-

ities, in most States, are regulated by their consumer-owners through locally elected or appointed officials. A more detailed discussion on utility classes of ownership is contained in the "Introduction" section of the first chapter in this publication.

Data Sources. Tables 3 through 10 contain data on the retail sales of electricity, its associated revenue, and the average number of consumers at the national, Census and State levels by sector and class of utility ownership. Statistics contained in Tables 3 through 10 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands, are not included in the summary statistics.

Electricity provides energy to light homes and shopping centers, and to run factories.

Table 3. U.S. Sales to Ultimate Consumers and Associated Revenue by Sector, 1988 Through 1992

Item	1992	1991	1990	1989	1988

Average Revenue per Kilowatthour

This chapter provides summary statistics on the average revenue per kilowatthour at the national, Census division, State, and electric utility levels.

Average Revenue per Kilowatthour at the National, Regional, and State Level

The average revenue per kilowatthour by sector and State is calculated by dividing total annual revenue by total annual retail sales for each sector and State. The resulting statistic is the average cost per kilowatthour of electricity sold by consumer sector. Many rate schedules have a minimum service charge and most have a declining rate per unit of consumption as consumption increases. Rate schedules for the commercial and industrial sectors almost always have a demand charge in addition to an energy charge. These charges lower the average revenue per kilowatthour as the consumption increases.

The average revenue per kilowatthour for residential consumers is generally higher than for any other sector, due in part to higher costs associated with serving many consumers who use relatively small amounts of electricity. These costs include direct-load costs (such as those for distribution lines, transformers, and meters) in addition to billing and other administrative costs. The industrial sector, which generally includes consumers with the highest use of electricity, has the lowest rates due to the economies of serving a few consumers who use relatively large amounts of electricity. Average revenue for the residential and commercial sectors increased fairly consistently from 1988 to 1992, but the average revenue for the industrial sector remained relatively flat. The residential sector's average revenue climbed 0.7 cents per kilowatthour from 7.5 cents in 1988 to 8.2 cents in 1992, and the commercial sector climbed 0.7 cents per kilowatthour from 7.0 cents in 1988 to 7.7 cents in 1992. The other sector showed an increase in average revenue in the last 3 years, climbing 0.5 cents per kilowatthour from 6.2 cents in 1989 to 6.7 cents in 1992. The industrial sector remained unchanged at 4.7 cents per kilowatthour from 1988 to 1990 and increased to 4.8 cents per kilowatthour in 1991 and remained unchanged in 1992. The industrial sector's average revenue indicates that some state utility commissions, during 1988 to 1990, probably approved lower rates for industrial consumers to better reflect the cost of services (Table 11).

The average revenue by ownership class also exhibits some interesting trends. Both investor-owned and publicly owned utilities show upward trends in average revenue, while the cooperatives remain relatively flat. The investor-owned utility average revenue surpassed the cooperatives average revenue for the first time during this 5 year period in 1991. The average revenue for Federal utilities continues to exhibit a declining trend, beginning at 3.8 cents per kilowatthour in 1988 and dropping to 2.6 cents in 1992.

Utility Demand-Side Management (DSM) programs designed to reduce system peak demands and energy requirements have become important components of utility load and resource plans. DSM programs are designed to modify consumption patterns and increase the efficient use of electricity. As a result, these programs may play a role in changing the consumers average consumption and average revenue per kilowatthour. The recently enacted Energy Policy Act of 1992 contains a section that promotes conservation and energy efficiency by encouraging utilities to expand DSM programs. It requires utilities and public utility commissions to consider requiring two new Federal standards that encourage DSM: integrated resource planning, which includes consideration of demand-side options with supply-side options; and cost recovery for energy efficiency programs that allows their profitability to be at least as attractive as supply-side option profitability.

Public concerns and stricter Federal and State environmental standards have forced electric utilities to reduce the release of toxic air emissions from power plants. Since environmental equipment can be a significant part of the cost of a power plant, the recent passage of the Clean Air Act Amendments (CAAA) of 1990 may increase electricity rates as the initial capital cost of installation and the recurring operation and maintenance (O&M) costs will affect utility revenue requirements.

Federal electric utilities generally have the lowest average revenue per kilowatthour for the ownership classes because they have access to relatively low-cost financing and generally utilize less expensive hydro-electric facilities. Because publicly owned electric utilities also have access to relatively low-cost financing and are nonprofit entities, they have lower average revenue per kilowatthour than investor-owned electric utilities. Although cooperative electric utilities have

economic advantages similar to those of the publicly owned electric utilities, they generally serve sparsely populated areas and provide service to a higher percentage of rural residential customers than other classes of utilities. As a consequence, cooperative electric utilities generally have a higher average revenue per kilowatthour than do investor-owned utilities.

Because of the type and availability of capacity and the cost of fuel, the average revenue per kilowatthour differs across U. S. Census divisions. Petroleum is generally a more expensive energy source than coal and natural gas. Therefore, the New England and Middle Atlantic Census Divisions tend to have an average revenue per kilowatthour that is higher than the national average because of their reliance on petroleum, whereas the East and West South Central Divisions rely on gas-fired generation and the East North Central

and South Atlantic Census Divisions rely on coal-fired generation. Because the Mountain Census Division relies on less expensive hydroelectric generation, the average revenue per kilowatthour in this region is usually below the national average for all classes of consumers. The Census divisions where Federal hydroelectric facilities provide significant amounts of electricity, such as the East South Central Census Division, also have lower than average revenue per kilowatthour.

Tables 11 through 13 contain summary statistics on the average revenue per kilowatthour of electricity sold at the national, Census division, and State level by sector and class of utility ownership. Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are not included in the summary statistics.

Average Revenue per Kilowatthour at the Electric Utility Level

The average revenue per kilowatthour of electricity sold for each utility is calculated in this report by dividing the total annual revenue of the electric utility by its total annual sales of electricity across all sectors. Because the average revenue per kilowatthour varies between sectors, the difference in average revenue per kilowatthour between utilities may represent a difference in their proportion of sales in the different sectors. Accordingly, the average revenue for a given utility does not reflect the differences that may exist in its revenue structure across sectors. The average revenue per kilowatthour at the utility level is usually between 4 and 12 cents per kilowatthour but the average may be larger or smaller for a particular sector, ownership type, or State.

Cooperative electric utilities are owned by their members and are established to provide electricity to those members. These electric utilities operate in rural areas with a lower concentration of consumers because these areas were historically viewed as uneconomical oper-

ations for investor-owned electric utilities. Cooperative electric utilities generally have broader service areas with smaller consumer bases than other ownership types and, as a consequence, they tend to have higher average revenue per kilowatthour. Cooperative electric utilities that serve consumers in multiple States tend to have even broader service areas and higher average revenue per kilowatthour. Average cents per kilowatthour are not provided in Tables 14 through 17 for those cooperative electric utilities or other electric utilities with revenue below \$100,000 or sales below 1,000 megawatthours.

For example, the Columbus Electric Cooperative, Incorporated, in New Mexico serves consumers in New Mexico as well as in Arizona. The residential average revenue per kilowatthour in Table 14 is 13.2 cents in New Mexico and 12.6 cents in Arizona. The commercial average revenue per kilowatthour in Table 15 is 11.6 cents for New Mexico. The commercial average revenue per kilowatthour is not provided for Arizona because the electric utility reported either less than \$100,000 of revenue or 1 million kilowatthours of sales in this State.

Around-the-clock operation is required in order that electric utilities may satisfy the needs of consumers of electricity.

Of the 83 reporting electric utilities in Alaska, 76 utilities have average revenue per kilowatthour exceeding the U.S. average. This occurs in part due to the lack of economies of scale in Alaska and because of the high costs associated with generation and distribution. The electric utilities that have higher costs charge higher rates for electricity to recover these costs from their consumers. The Power Cost Equalization (PCE) subsidy by the State of Alaska was initially designed to compensate consumers served by electric utilities located in rural areas where transmission access is limited and electric power generation is with expensive diesel gas turbines. The Alaska Energy Authority (AEA) administers the subsidy with funds from a State statute since Alaska has no State income tax. Electric utilities qualifying for the PCE program are required to notify consumers of the cost of electric service and the cost minus the State equalization. Consumers receiving the subsidy do not actually pay the high rates. The subsidy is allocated to electric utilities based on consumer sector and demand for electricity within each sector. In Tables 14 through 17, the PCE subsidy has not been subtracted from the total revenue of those electric utilities receiving compensation for high energy costs.

Electric utilities operating on islands with high seasonal populations also tend to have much higher average revenue per kilowatthour. Higher demand charges are needed to recover the fixed equipment and operating costs associated with generating electricity at infrequent times. These electric utilities are few and are primarily located on the East Coast and in the Great Lakes area.

Data on the number of consumers, revenue, sales, and average revenue per kilowatthour for individual electric utilities are contained in Tables 14 through 17. The average revenue per kilowatthour presented in Tables 14 through 17 are based on an average for each of the end-use sectors. When an electric utility provided service to ultimate consumers in more than one State, that utility is listed under each State it serviced. The electric utilities in Table 14 through 17 that provided service to ultimate consumers in more than one State and their percent of sales in each State are shown in Appendix A. Tables 14 through 16 contain the respective consumers, sales, revenue, and average revenue per kilowatthour by each sector for all electric utilities. Table 17 contains the respective sales, revenue, and average revenue for the sum of all sectors. This includes the residential, commercial, and industrial sectors, as well as public street and highway lighting, interdepartmental sales, sales to railroads and railways, and sales to other public authorities.

Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of these data are not sufficient to make the ratio meaningful. See Appendix B for further information.

Data Sources. Statistics contained in Tables 11 through 17 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are included only in Tables 14 through 17, and not in the summary statistics.

Total (Includes the Four Power Authorities)		100,661,101	77,279,795	941,221,974	8.2

¹ The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

² Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity. PCE subsidy has not been subtracted from the total revenue of those utilities receiving compensation for high energy costs.

³ The U.S. total excludes the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Notes: •Data for 1992 are final. •Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

Total (Includes the Four Power Authorities)		12,486,210	58,954,915	767,010,556	7.7

¹ The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

² Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity. PCE subsidy has not been subtracted from the total revenue of those utilities receiving compensation for high energy costs.

³ The U.S. total excludes the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Notes: •Data for 1992 are final. •Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

Total (Includes the Four Power Authorities)		551,380	47,309,853	976,455,514	4.8

¹ The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

² Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity. PCE subsidy has not been subtracted from the total revenue of those utilities receiving compensation for high energy costs.

³ The U.S. total excludes the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Notes: •Data for 1992 are final. •Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

Total (Includes the Four Power Authorities)		114,562,064	189,937,659	2,776,917,079	6.8

¹ The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

² Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity. PCE subsidy has not been subtracted from the total revenue of those utilities receiving compensation for high energy costs.

³ The U.S. total excludes the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Notes: •Data for 1992 are final. •Electric utilities serving consumers in more than one State are listed under each State served.

Appendix A

Electric Utilities Serving Ultimate Consumers in More Than One State

This appendix contains information from the Form EIA-861, "Annual Electric Utility Report," regarding electric utilities that serve ultimate consumers in more than one State (Table A1). Additionally, the percent of sales of electricity in each State is included in Table A1. The information can be used as a reference to Tables 14 through 17. For example, information contained in Table A1 indicates that the Appalachian Power Company serves consumers in Virginia and West Virginia. Tables 14 through 17 contain the respective

sales, revenue, and average revenue by each sector and for all sectors for this electric utility in both States. The majority of utilities that serve ultimate consumers in more than one State are the investor-owned electric utilities. These electric utilities generally have large franchise service areas and historically have served retail consumers in more than one State. Publicly owned electric utilities usually are chartered by municipal or State governments and usually provide service within the cities or counties where they are located.

Appendix B

Technical Notes

Technical Notes

Sources of Data

The *Electric Sales and Revenue (ESR)* is prepared by the Survey Management Division, Office of Coal, Nuclear, Electric and Alternate Fuels (CNEAF), Energy Information Administration (EIA), U.S. Department of Energy. Data published in the *ESR* are compiled from the EIA statistical Form EIA-861, "Annual Electric Utility Report." A brief summary of the form is presented below.

Form EIA-861

The Form EIA-861 is a mandatory census of electric utilities in the United States. The survey is used to collect information on power production and sales data from approximately 3,250 electric utilities. The data collected are used to maintain and update the electric utility frame data base of the EIA. This data base supports queries from the Executive Branch, Congress, other public agencies, and the general public. Summary data from the Form EIA-861 are also contained in the *Electric Power Monthly*, the *Electric Power Annual*, the *Financial Statistics of Major U.S. Investor-Owned Electric Utilities*, and the *Financial Statistics of Major U.S. Publicly Owned Electric Utilities*. These reports present aggregate totals for electric utilities at the national, regional, and State level by consumer classes. Data for the four power authorities of the Virgin Islands, American Samoa, Guam, and Puerto Rico are included only in Tables 14 through 17, and not in the summary statistics.

Instrument and Design History. The Form EIA-861 was implemented in January 1985 to collect data as of year-end 1984. The Federal Energy Administration Act of 1974 (Public Law 93-275) defines the legislative authority to collect these data.

Data Processing. The Form EIA-861 is mailed to the respondents in January to collect data as of the end of the preceding calendar year. The completed forms are to be returned to the EIA by April 1. These data are manually edited before being entered into the interactive on-line system. Internal edit checks are performed to verify that current data total across and between schedules, and are comparable to data reported the

previous year. Edit checks are also performed to compare data reported on the Form EIA-861 with similar data reported on the Forms EIA-826, EIA-412, and Federal Energy Regulatory Commission Form 1. Respondents are contacted by telephone to obtain clarification of reported data or to obtain missing data.

Form EIA-861 figures shown in this publication differ somewhat from the sum of the monthly Form EIA-826 figures for sales published in the *Electric Power Monthly* and in issues of the *Electric Power Annual* prior to 1988. Both forms use sectorial classifications (residential, commercial, and industrial) based on the usual classification of consumers by the electric utilities. At the national level, the Form EIA-861 and Form EIA-826 figures corresponded closely (within 3 percent) for all end-use sectors. Some larger differences were observed at the State level particularly for Tennessee due to inconsistent classification of commercial and industrial data between the Form EIA-826 and the Form EIA-861 surveys.

Differences between the Form EIA-861 and Form EIA-826 figures can result from the Form EIA-826 sampling procedure and/or from nonsampling error in either data collection. One source of nonsampling error in the Form EIA-826 stems from the practice of filing estimates for monthly sales and revenue when the actual figures are not yet available. Although respondents are instructed to file revisions, revisions are not always filed. The respondents are instructed to review their Form EIA-826 figures at the end of the reporting year to ensure consistency with Form EIA-861 figures. Survey analysts at the EIA compare these data series and attempt to resolve any differences. Nevertheless, some reporting differences remain.

Electric revenue and sales data are rounded and reported by electric utilities in thousand dollars and thousand kilowatthours. For this publication the average revenue per unit cost of electricity sold is calculated by dividing total electric revenue by the total sales of electricity. For Tables 14 through 17 the average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Quality of Data

The CNEAF office is responsible for routine data improvement and quality assurance activities. All operations in this office are done in accordance with formal standards established by the EIA. These standards are the measuring rod necessary for quality statistics. Data improvement efforts include verification of data-keyed input by automatic computerized methods, editing by subject matter specialists, and followup on nonrespondents. The CNEAF office supports the quality assurance efforts of the data collectors by providing advisory reviews of the structure of information requirements and of proposed designs for new and revised data collection forms and systems. Once implemented, the actual performance of working data collection systems is also validated. Computerized respondent data files are checked to identify those who fail to respond to the survey. By law, nonrespondents may be fined or otherwise penalized for not filing a mandatory EIA data form. Before invoking the law, the EIA tries to obtain the required information by encouraging cooperation of nonrespondents.

Completed forms received by the CNEAF office are sorted, screened for completeness of reported information, and keyed onto computer tapes for storage and transfer to random access data bases for computer processing. The information coded on the computer tapes is manually spot-checked against the forms to certify accuracy of the tapes. To ensure the quality standards established by the EIA, formulas that use the past history of data values in the data base have been designed and implemented to automatically check data input for errors. Data values that fall outside the ranges prescribed in the formulas are verified by telephoning respondents to resolve any discrepancies.

Data Editing System

Data from the Form EIA-861 are edited on an annual basis using automated systems. The edits include both deterministic checks, in which records are checked for the presence of required fields and their validity, and statistical checks, in which estimation techniques are used to validate data according to their behavior in the past and in comparison to other current fields.

Confidentiality of the Data

The data collected on the forms used for input to this report are not confidential.

Formulas

Average Revenue per Kilowatthour. The average revenue per unit cost of electricity sold is calculated by dividing total annual revenue by total annual sales of electricity.

Calculation Effects of Average Revenue Per Kilowatthour and Sales on Revenue.

Δr = Change in average revenue from $year_1$ to $year_2 = r_2 - r_1$

ΔS = Change in sales from $year_1$ to $year_2 = S_2 - S_1$

ΔR = Change in revenue from $year_1$ to $year_2 = R_2 - R_1$

$\Delta R = (S_2)\Delta r + (r_1)\Delta S$

Effect of change in average revenue on change in

$$\text{revenue} = \frac{(S_2)\Delta R}{(S_2)\Delta r + (r_1)\Delta S} * 100 \%$$

Effect of change in sales on change in revenue =

$$\frac{(r_1)\Delta S}{(S_2)\Delta r + (r_1)\Delta S} * 100 \%$$

Rounding Rules for Data

Given a number with r digits to the left of the decimal and $d+t$ digits in the fraction part, with d being the place to which the number is to be rounded and t being the remaining digits that will be truncated, this number is rounded to $r+d$ digits by adding 5 to the $(r+d+1)$ th digit when the number is positive or by subtracting 5 when the number is negative. The t digits are then truncated at the $(r+d+1)$ th digit. The symbol for a rounded number truncated to zero is (*).

Data Correction Procedure

The CNEAF office has adopted the following policy with respect to the revision and correction of the Form EIA-861 data published in this report and made available in a machine format:

- Publication of these data results in their finalization at which point the data base is closed.
- Revisions or corrections are made only in the event a substantial (greater than 1 percent) reporting change is received or a substantial (greater than 1 percent) error is discovered.
- No revisions will be made without the approval of the Director, Survey Management Division.

Table B1. Unit-of-Measure Equivalents for Electricity

Unit	Equivalent		
Kilowatt (kW)	1,000	(One Thousand)	Watts
Megawatt (MW)	1,000,000	(One Million)	Watts
Gigawatt (GW)	1,000,000,000	(One Billion)	Watts
Terawatt (TW)	1,000,000,000,000	(One Trillion)	Watts
Gigawatt	1,000,000	(One Million)	Kilowatts
Thousand Gigawatts	1,000,000,000	(One Billion)	Kilowatts
Kilowatthours (kWh)	1,000	(One Thousand)	Watthours
Megawatthours (MWh)	1,000,000	(One Million)	Watthours
Gigawatthours (GWh)	1,000,000,000	(One Billion)	Watthours
Terawatthours (TWh)	1,000,000,000,000	(One Trillion)	Watthours
Gigawatthours	1,000,000	(One Million)	Kilowatthours
Thousand Gigawatthours	1,000,000,000	(One Billion)	Kilowatthours

Obtaining Copies of Data or the Form

Upon EIA approval of the *Electric Sales and Revenue*, the data become available for public use on a cost-recovery basis. Computer listings may be obtained by submitting a written request to:

Energy Information Administration, EI-521
Forrestal Building
U.S. Department of Energy
Washington, DC 20585

These data are also available on machine-readable tapes. Tapes may be purchased by using Visa, Master Card, or American Express cards, as well as money orders or checks payable to the National Technical Information Service (NTIS). Purchasers may also use NTIS and Government Printing Office depository ac-

counts. To place an order, contact:

National Technical Information Service (NTIS)
Office of Data Base Services
U.S. Department of Commerce
5285 Port Royal Road
Springfield, Virginia 22161
(703) 487-4650

Copies of the form and its instructions may be obtained from the National Energy Information Center (NEIC). The address and telephone number appear below.

National Energy Information Center, EI-231
Energy Information Administration
Forrestal Building, Room 1F-048
Washington, DC 20585

Glossary

Base Bill: A charge calculated by taking the rate from the appropriate electric rate schedule and applying it to the level of consumption.

Base Rate: A fixed per kilowatthour charge for electricity consumed that is independent of other charges and/or adjustments.

Block Rate Schedule: An electric rate schedule with a provision for charging a different unit cost for various increasing blocks of demand or energy. Usually a reduced price is charged on succeeding blocks.

Census Divisions: The nine geographic divisions of the United States established by the Bureau of the Census, U.S. Department of Commerce for statistical analysis. The boundaries of Census divisions coincide with State boundaries. The Pacific Division is subdivided into the Pacific Contiguous and Pacific Noncontiguous areas.

Classes of Service: Consumers grouped by similar characteristics in order to be identified for the purpose of setting a common rate for electric service. Usually classified into groups identified as residential, commercial, industrial and other.

Class Rate Schedule: An electric rate schedule applicable to one or more specified classes of service, groups of businesses, or customer uses.

Commercial Sector: The commercial sector is generally defined as nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, and health, social, and educational institutions. Electric utilities may classify commercial service as service that includes all consumers whose demand or annual use exceeds some specified limit. The limit may be set by the utility based on the rate schedule of the utility. Consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifica-

tions, should be classified based on the schedule they most closely resemble. If there is no rate schedule distinction, utilities may define commercial consumers as those having a demand of less than 1000 kilowatts.

Consumer Charge: An amount charged periodically to a consumer for such utility costs as billing and meter reading, without regard to demand or energy consumption.

Cooperative Electric Utility: A group organized under the law into a utility company that will generate, transmit, and/or distribute supplies of electric energy to a specified area not being serviced by another utility. Such ventures are generally exempt from the Federal income tax laws. Most electric cooperatives have initially been financed by the Rural Electrification Administration, U.S. Department of Agriculture.

Cost of Service: A ratemaking concept used for the design and development of rate schedules to ensure that the filed rate schedules recover only the cost of providing the electric service at issue. These costs include operating and maintenance expenses, depreciation and amortization expenses, and income and other taxes found just and reasonable by the regulatory agency for ratemaking purposes plus, in the case of privately owned electric utilities, an allowance for a return on capital (usually computed by applying a rate of return to the rate base). This concept attempts to equate the cost incurred by the utility to the revenue received for the service provided to each of the consumer classes.

Demand (Electric): The rate at which electric energy is delivered to or by a system, part of a system, or piece of equipment, at a given instant or averaged over any designated period of time.

Demand Charge: That portion of the consumer's bill for electric service based on the consumer's maximum electric capacity usage and calculated based on the

billing demand charges under the applicable rate schedule.

Energy Information Administration (EIA): An independent agency within the U.S. Department of Energy that develops surveys, collects energy data, and does analytical and modeling analysis of energy issues. The Agency must meet the requests of Congress, other elements within the Department of Energy, Federal Energy Regulatory Commission, the Executive Branch, its own independent needs, and assist the general public, or other interest groups, without taking a policy position.

Economy of Scale: The principle that larger production facilities have lower unit costs than smaller facilities.

Electric Power Industry: The privately, publicly, federally and cooperatively owned electric utilities of the United States taken as a whole. This includes all electric systems serving the public: regulated investor-owned electric utility companies; Federal power projects; State, municipal, and other government-owned systems, including electric public utility districts; electric cooperatives, including generation and transmission entities. Excluded from this definition are the special purpose electric facilities or systems that do not offer service to the public.

Electric Rate: The price set for a specified amount of electricity in an electric rate schedule or sales contract.

Electric Rate Schedule: A statement of the electric rate and the terms and conditions governing its application, including attendant contract terms and conditions that have been accepted by a regulatory body with appropriate oversight authority.

Electric Utility: An enterprise that is engaged in the generation, transmission, or distribution of electric energy primarily for use by the public and that is the major power supplier within a designated service area. Electric utilities include privately owned, publicly owned, cooperatively owned, and government-owned (municipals, Federal agencies, State projects, and public power districts) systems.

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic en-

ergy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Federal Energy Regulatory Commission (FERC): A quasi-independent regulatory agency within the Department of Energy having jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification.

Flat and Meter Rate Schedule: An electric rate schedule consisting of two components, the first of which is a service charge, and the second a price for the energy consumed.

Flat Demand Rate Schedule: An electric rate schedule based on billing demand that provides no charge for energy.

Gigawatt (GW): One billion watts.

Gigawatthour (GWh): One billion watthours.

Industrial Sector: The industrial sector is generally defined as including manufacturing, construction, mining, agriculture, fishing, and forestry establishments under Standard Industrial Classification (SIC) codes 01-39. The utility may classify industrial service using the SIC codes, or based on demand or annual usage exceeding some specified limit. The limit may be set by the utility based on its own rate schedule. Sales for consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifications, should be classified based on the classification of their rate most closely resembles. If there is no rate schedule distinction, utilities may define industrial consumers as those having a demand equal to or greater than 1,000 kilowatts.

Interdepartmental Sales: Includes amounts charged by the electric department at tariff or other specified rates for electricity supplied by it to other utility departments.

Investor-Owned Electric Utility: A class of utility that is investor owned and organized as a tax paying business, usually financed by the sales of securities in the capital market.

Kilowatt (kW): One thousand watts.

Kilowatthour (kWh): One thousand watthours.

Megawatt (MW): One million watts.

Megawatthour (MWh): One million watthours.

Other Sector: Electricity supplied to public street and highway lighting, other service to public authorities, service to railroads and and railways, and interdepartmental service.

Power (Electrical): An electric measurement unit of power called a voltampere is equal to the product of 1 volt and 1 ampere. This is equivalent to 1 Watt for a direct current system and a unit of apparent power is separated into real and reactive power. Real power is the work-producing part of apparent power that measures the rate of supply of energy and is denoted as kilowatts (KW). Reactive power is the portion of apparent power that does no work and is referred to as kilovars; this type of power must be supplied to most types of magnetic equipment, such as motors, and is supplied by generator or by electrostatic equipment. Voltamperes are usually divided by 1,000 and called kilovoltamperes (kVA). Energy is denoted by the product of real power and the length of time utilized; this product is expressed as kilowatthours.

Public Authorities: Electricity supplied to municipalities or divisions or agencies of State and Federal governments, usually under special contracts or agreements that are applicable only to public authorities.

Public Street and Highway Lighting Service: Electricity supplied and services rendered for the purpose of lighting streets, highways, parks, and other public places; or for traffic or other signal system service, for municipalities, or other divisions or agencies of State or Federal governments.

Publicly Owned Electric Utility: A class of utility that includes those utilities operated by municipalities, po-

litical subdivisions, utility or power districts, and State and Federal power agencies.

Railroad and Railway Electric Service: Electricity supplied to railroads and interurban and street railways, for general railroad use, including the propulsion of cars or locomotives, where such electricity is supplied under separate and distinct rate schedules.

Rate Base: The value of property upon which a utility is permitted to earn a specified rate of return as established by a regulatory authority. The rate base generally represents the value of property used by the utility in providing service and may be calculated by any one or a combination of the following accounting methods: fair value, prudent investment, reproduction cost, or original cost. Depending on which method is used, the rate base includes cash, working capital, materials and supplies, and deductions for accumulated provisions for depreciation, contributions in aid of construction, customer advances for construction, accumulated deferred income taxes, and accumulated deferred investment tax credits.

Residential Sector: The residential sector includes private household establishments that consume energy primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. The classification of an individual consumer's account, where the use is both residential and commercial, is based on principal use. Apartment houses are included.

Retail: Sales covering electrical energy supplied for residential, commercial, and industrial end-use purposes. Other small classes, such as agriculture and street lighting, also are included in this category.

Rural Electrification Administration (REA): A lending agency of the U.S. Department of Agriculture, the REA makes self-liquidation loans to qualified borrowers to finance electric and telephone service to rural areas. The REA also finances the construction and operation of generating plants, electric transmission and distribution lines, or systems for the furnishing of initial and continued adequate electric services to persons in rural areas not receiving central station service.

Sales: The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. Other sales include public street and highway lighting,

other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Schedule: A statement of the pricing format of electricity and the terms and conditions governing its applications.

Seasonal Rates: Different seasons of the year are structured into an electric rate schedule whereby an electric utility provides service to consumers at different rates. The electric rate schedule usually takes into account demand based on weather and other factors.

Special Contract Rate Schedule: An electric rate schedule for an electric service agreement between a utility and another party in addition to, or independent of, any standard rate schedule.

Special Purpose Rate Schedule: An electric rate schedule limited in its application to some particular purpose

or process within one, or more than one, type of industry or business.

Tariff: A published volume of rate schedules and general terms and conditions under which a product or service will be supplied.

Time-of-Day Rate: The rate charged by an electric utility for service to various classes of customers. The rate reflects the different costs of providing the service at different times of the day.

Watt: The electrical unit of power. The rate of energy transfer equivalent to 1 ampere flowing under a pressure of 1 volt at unity power factor.

Watthour (Wh): An electrical energy unit of measure equal to 1 watt of power supplied to, or taken from, an electric circuit steadily for 1 hour.

Preface

The *Electric Sales and Revenue* is prepared by the Survey Management Division, Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA); U.S. Department of Energy. This publication provides information about sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to residential, commercial, industrial, and other consumers throughout the United States.

The sales, revenue, and average revenue per kilowatthour data provided in the *Electric Sales and Revenue* are based on annual data reported by electric utilities for the calendar year ending December 31, 1993. Operating revenue includes energy charges, demand charges, consumer service charges, environmental surcharges, fuel adjustments, and other miscellaneous charges. The revenue does not include taxes, such as sales and excise taxes, that are assessed on the consumer and collected through the utility. Average revenue per kilowatthour is defined as the cost per unit of electricity sold and is calculated by dividing retail sales into the associated electric revenue. Because electric rates vary based on energy usage, average revenue per kilowatthour are affected by changes in the volume of sales. The sales of electricity, associated revenue, and average revenue per kilowatthour data provided in this report are presented at the national, Census division, State, and electric utility levels.

The electric power industry is experiencing the emergence of a more competitive, market-driven approach that will likely result in considerable change in the industry over the next several years. The industry change will be reflected in the sales, revenue, and average revenue per kilowatthour data presented in this publication. The Energy Policy Act of 1992 (EPACT) removed some constraints on ownership of electric generation facilities and encouraged increased competition in the wholesale electric power business. An increased interest in performance-based ratemaking and retail wheeling, as well as cuts in common dividends and employee layoffs, all point to an increasingly more competitive electric power industry. Presently, electric rates are based on embedded historical costs. Future electric rates are likely to be more dynamic and reflect

tive of the current cost of providing service. Unbundling of electric power services and prices that reflect time-of-day and seasonal variations will become more common with the increased interaction of the consumer with the utility.

Target Audience

In the private sector, users of the *Electric Sales and Revenue* include researchers, analysts, and ultimately the policy- and decision-making members of electric utility companies. Other users include financial and investment institutions, economic development organizations, special interest groups, lobbyists, electric power associations, and the news media.

In the public sector, the users include analysts, researchers, statisticians, and other professionals engaged in regulatory, policy, and program areas for Federal, State, and local governments. The Congress, other legislative bodies, public service commissions, and other special government groups are also interested in general trends related to electricity at State and national levels. Data in this report can be used in analytic studies to evaluate new legislation and regulatory alternatives, and to forecast future demand for electric power.

Coverage of Sources

Data published in the *Electric Sales and Revenue* are compiled from the Form EIA-861, "Annual Electric Utility Report." The Form EIA-861 is a census of electric utilities in the United States, its territories, and Puerto Rico. The form collects information on the production and sale of electricity from approximately 3,200 electric utilities (Figure 1). The form is described in more detail in Appendix B, "Technical Notes." Copies of the form and its instructions may be obtained from the National Energy Information Center (NEIC).

Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are included in Table 14 through Table 17, but not in the national, Census division, and State level statistics.

Profile

This chapter contains two sections. The "Background" section provides a discussion on (1) sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to ultimate consumers, (2) the classes of electric utility ownership, and (3) the classes of service or sectors. The "Year at a Glance" section provides a summary of pertinent statistics related to sales of electricity, associated revenue, and average revenue per kilowatthour.

Background

Sales, Revenue, and Average Revenue per Kilowatt-hour. Electric power is an integral part of our way of life. It is indispensable to the factory, the commercial establishment, the home, and even most recreational facilities. The unavailability of electric power causes inconvenience to customers as well as economic loss due to reduced industrial production. Electric utilities are responsible for ensuring an adequate and reliable source of electricity to all consumers in their service territories at a reasonable cost.

Electric utilities are regulated by local, State, and Federal authorities. Generally, interstate activities (those that cross State lines) are subject to Federal regulation, while intrastate activities are subject to State regulation. Wholesale rates (sales and purchases among electric utilities), licensing of hydroelectric facilities, questions of nuclear safety and high-level nuclear waste disposal, and environmental regulation are federally mandated. Approval for most plant and transmission line construction and retail rate levels are State regulatory functions.

The primary electricity jurisdiction of the State utility commissions includes the almost 300 generally large, vertically integrated, investor-owned utilities who own over 75 percent of the nation's generating and transmission capacity and serve over 75 percent of the load. There are over 2,000 publicly owned utilities serving almost 15 percent of the load and approximately 950 consumer-owned rural cooperatives. Approximately 20 States regulate cooperatives and 7 States regulate municipal utilities. Many State legislatures leave it to the local municipal officials or cooperative members to provide control.

The service territory of an electric utility is geographically distinct and is usually composed of many differ-

ent combinations of consumers. Electric utilities classify their consumers by different factors, such as level of electrical demand, rate schedule, Standard Industrial Classification (SIC) code, distribution voltage, accounting methods, end-use applications, and other social and economic characteristics. Electric utilities use consumer classifications for planning (load growth, peak demands), and for determining their sales and revenue requirements (cost of service) in order to derive their rates.

Average revenue per kilowatthour is defined as the cost per unit of electricity sold and is calculated by dividing retail electric revenue by the corresponding sales of electricity. The average revenue per kilowatthour is calculated for all consumers and for each sector (residential, commercial, industrial, and other sales).

Utilities typically employ a number of rate schedules within a single sector. These alternative rate schedules reflect the varying consumption levels and patterns of these consumers and their associated impact on the utility's costs of providing electrical service. The average revenue per kilowatthour reported in this publication by sector represents a weighted average of customer revenue and sales within that sector and across sectors for all consumers.

The electric revenue used to derive the average revenue per kilowatthour is the operating revenue reported by the utility. Operating revenue includes energy charges, demand charges, consumer service charges, environmental surcharges, fuel adjustments, and other miscellaneous charges.

Utility operating revenues include, among other costs of service, State and Federal income taxes and taxes other than income taxes paid by the utility. The Federal component of these taxes are, for the most part, "payroll" taxes. State and local authorities tax the value of plant (property taxes), the amount of revenues (gross receipts taxes), purchases of materials and services (sales and use taxes), and a potentially long list of other taxes that vary extensively by taxing authority. Taxes deducted from employees' pay, such as Federal income taxes and employees' share of social security taxes are not a part of the utility's "tax costs," but are paid to the taxing authorities in the name of the employees. These taxes are included in the utility's cost of service (i.e., revenue requirements) and are included in the

amounts recovered from the customer in rates and reported in operating revenues.

Electric utilities, like other business enterprises, are required by various taxing authorities to collect and remit taxes assessed on its customers. In this regard, the utility serves as an agent for the taxing authority. Taxes assessed on the consumer, such as a gross receipts tax or sales tax, are referred to as "pass through" taxes. These taxes do not represent a cost to the utility and are not recorded in the operating revenues of the utility. However, taxing authorities differ in whether a specific tax is assessed to the utility or to the consumer, which in turn determines whether or not the tax is included in the electric utility's operating revenues.

Average revenue per kilowatthour is affected by changes in the rate schedules used by the electric utilities and by changes in the volume of electricity sales. Because fixed charges remain constant regardless of the volume of sales, average revenue per kilowatthour will decrease as the volume of sales increases. A change in average revenue per kilowatthour may occur when the volume of electricity sales changes (because of an increase/decrease in the use of electricity by the individual consumer or an increase/decrease in the number of ultimate consumers) across all sectors or within a specific sector. Generally, the rate schedules used by electric utilities are designed so that revenue increases more slowly as the volume of sales increases, lowering the average revenue per kilowatthour. The net effect of these factors on the average revenue per kilowatthour presented in this publication has not been determined. Average revenue per kilowatthour is in part impacted by class of utility ownership and by class of service (sector). Consequently, data are presented in this publication by class of ownership and sector.

Classes of Ownership. The electric power industry in the United States is a combination of approximately 3,200 investor-owned, publicly owned, Federal, and cooperative electric utilities. Historically, investor-owned electric utilities have been most successful in serving large, consolidated markets where economies-of-scale afforded the lowest prices. However, publicly owned, Federal, and cooperative electric utilities all have a role in producing, transmitting, and distributing electricity.

Like all private businesses, the fundamental objective of an investor-owned utility is to produce a return for its investors. The investor-owned electric utility either distributes its profits to stockholders as dividends or reinvests these profits. It is granted a service monopoly in certain geographic areas and is obliged to serve all consumers. As franchised monopolies, these utilities are regulated and required to charge reasonable prices, to charge comparable prices to similar classifications of consumers, and to give consumers access to services under similar conditions. Most investor-owned electric utilities are operating companies that provide basic ser-

vices for the generation, transmission, or distribution of electricity. The majority of investor-owned utilities perform all three functions. There are approximately 270 investor-owned electric utilities operating in all States except Nebraska. The electric utilities in Nebraska consist primarily of municipal systems and public power districts. Investor-owned electric utilities, while representing only 8 percent of the total number of electric utilities, account for more than 75 percent of all electric utility generating capability, generation, sales, and revenue in the United States.

The approximately 2000 publicly owned electric utilities represent 62 percent of the number of electric utilities, supply approximately 10 percent of generation and generating capability, and represent approximately 13 percent of the sales and revenue. Publicly owned electric utilities are nonprofit local government agencies established to provide service to their communities and nearby consumers at cost, returning excess funds to the consumer in the form of community contributions, more economic and efficient facilities, and lower rates. Publicly owned electric utilities include municipalities, public power districts, State authorities, irrigation districts, and other State organizations. Most municipal utilities simply distribute power, although some larger ones produce and transmit electricity as well. They obtain their financing from municipal treasuries and from revenue bonds secured by proceeds from the sale of electricity. Public power districts and projects are concentrated in Nebraska (which has no investor-owned electric utilities), Washington, Oregon, Arizona, and California. Voters in a public utility district (PUD) elect commissioners or directors to govern the district independent of any municipal government. State authorities, like the Power Authority of the State of New York or the South Carolina Public Service Authority, are agencies of their respective State governments. Irrigation districts may have still other forms of organization. In the Salt River Project, votes for the board of directors are apportioned according to the size of landholdings.

Cooperative electric utilities comprise approximately 30 percent of the number of electric utilities and represent 8 percent of sales and revenue and about 4 percent of generation and generating capability. Cooperative electric utilities are owned by their members and are established to provide electricity to those members. These electric utilities operate in rural areas with a lower concentration of consumers because these areas are historically viewed as uneconomical operations for investor-owned electric utilities. They are incorporated under State law and are usually directed by an elected board of directors, which in turn selects a manager. The Rural Electrification Administration, the National Rural Utilities Cooperative Finance Corporation, the Federal Financing Bank, and the Bank for Cooperatives are the most important sources of debt financing for electric cooperatives. There are approximately 950 electric cooperatives currently doing business in 47 States. Cooperative electric utilities do not

operate in Connecticut, Hawaii, and Rhode Island, or in the District of Columbia.

The 10 Federal electric utilities in the United States while less than 1 percent of the number of electric utilities, provide almost 10 percent of generating capability and generation, but less than 2 percent of sales to ultimate consumers and the associated revenue. The Federal electric utilities are the Department of Defense-U.S. Army Corps of Engineers; the Department of Energy: Alaska, Bonneville, Southeastern, Southwestern, and Western Area Power Administrations; the Department of Interior: U.S. Bureau of Indian Affairs and the U.S. Bureau of Reclamation; the Department of State-International Boundary and Water Commission; and the Tennessee Valley Authority. The Federal electric utilities are primarily generators and wholesalers of electricity rather than distributors to ultimate consumers. Federal electric utilities operate approximately 180 power plants. Most of the power plants are Federal hydroelectric projects initially designed for flood control and irrigation purposes. Federal power is not sold for profit, but to recover the cost of operations. Most Federal generation is sold for resale to municipalities, cooperative electric utilities, and other nonprofit preference customers, as required by law. Three Federal agencies operate Federal generating facilities: the Tennessee Valley Authority (TVA), the largest Federal producer; the U.S. Army Corps of Engineers (USCE); and the U.S. Bureau of Reclamation (USBR). The TVA markets its own power while the generation by the USCE, except for the North Central Division (St. Mary's Falls at Sault St. Marie, Michigan), and the USBR is marketed by four of the Federal power marketing administrations (PMA): Bonneville, Southeastern, Southwestern, and Western Area. The four PMA's also purchase energy for resale from other electric utilities in the United States and Canada. Alaska, the fifth PMA, operates its own power plants and distributes power to ultimate consumers. The majority of electricity generated by Federal electric utilities is sold for resale, not to ultimate consumers.

Classes of Service (Sectors). Electricity consumers are divided into classes of service or sectors (*residential, commercial, industrial, and other*) based on the type of service they receive. Sectorial classification of consumers is determined by each electric utility and is based on different criteria such as demand level, rates, Standard Industrial Classification (SIC) code, accounting methods, end-use activity and other social and economic characteristics. Reclassification of consumers, usually between the commercial and industrial sectors, may occur from year-to-year due to changes in demand level, economic factors, or other factors. For this reason, the commercial and industrial sectors are discussed collectively as the "nonresidential" sector in some dis-

cussions in this publication. The residential sector remains relatively stable from year to year.

The residential sector includes electricity supplied to private household establishments and apartment buildings where energy is consumed primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying.

The commercial sector includes electricity supplied to nonmanufacturing business establishments and sometimes small manufacturing facilities, including hotels, motels, restaurants, wholesale businesses, and retail stores; and health, social, and educational institutions. An electric utility may classify commercial consumers as those consumers whose demand and/or usage exceeds specified limits. The limits are set by the electric utility based on different rate schedules.

The industrial sector includes electricity supplied to manufacturing, construction, mining, agriculture, fishing, and forestry establishments -- Standard Industrial Classification (SIC) codes 1 through 39. An electric utility may classify industrial consumers using these SIC codes, or it may classify industrial consumers based on demand and/or usage exceeding specified limits. As in the commercial sector, the limits are set by the electric utility based on different rate schedules.

Sales to other consumers include public street and highway lighting, railroads and railways, municipalities, divisions or agencies of State and Federal Governments under special contracts or agreements, and other utility departments, as defined by the pertinent regulatory agency and/or electric utility. Sales to these consumers, as well as the residential, commercial, and industrial consumers may be classified differently by each electric utility because of different rates, demand levels, and the economic activities of the consumers.

The Year at a Glance

In 1993, total sales of electricity to ultimate consumers were 2,861 billion kilowatthours and total revenue was \$198 billion (Table 1). Sales to the residential sector in 1993 were 995 billion kilowatthours, representing 35 percent of total sales to ultimate consumers, and revenue was \$83 billion, representing 42 percent of the total associated revenue. The nonresidential sector¹ (i.e., the commercial and industrial sectors) had sales of 1,772 billion kilowatthours, representing 62 percent of sales to ultimate consumers, and \$109 billion in revenue, representing 55 percent. The average revenue per kilowatthour of electricity sold to ultimate consumers in the United States in 1993 was 6.93 cents (Table 2). Average revenue per kilowatthour in 1993 for the res-

¹Changes for the nonresidential sector (nonresidential refers to the commercial and industrial sectors only) are discussed as caution must be used in analyzing year to year changes in the commercial and industrial sectors because electric utilities may have reclassified their consumers between the commercial and industrial sectors.

idential and nonresidential sectors was 8.32 and 6.15 cents, respectively.

Average Revenue by Sector and Ownership. Because Federal electric utilities have access to relatively low-cost financing and mostly utilize less expensive hydroelectric facilities, they have the lowest average revenue per kilowatthour, at 2.77 cents, of all the ownership classes for all sectors. The average revenue per kilowatthour of publicly owned electric utilities in the residential sector, at 6.63 cents, was 14 percent below that for cooperative electric utilities at 7.73 cents and 24 percent below that of investor-owned electric utilities at 8.77 cents (Table 2). The average revenue per kilowatthour of publicly owned electric utilities in the nonresidential sectors, at 5.67 cents, was 2 percent below that for cooperative electric utilities at 5.83 cents and 10 percent below that for investor-owned electric utilities at 6.34 cents.

Sales by Sector. Sales of electricity rose approximately 4 percent in 1993 to 2,861 billion kilowatthours. Sales of electricity to the residential sector increased by 6 percent (59 billion kilowatthours) in 1993. Sales of electricity to the nonresidential sector increased 2 percent (38 billion kilowatthours) in 1993.

Revenue by Sector. The total revenue from sales of electricity increased 5 percent in 1993 to \$198 billion (Table 3). Revenue increased by 8 percent for the residential sector in 1993. The average revenue per kilowatthour for the residential sector increased by 1 percent from 8.21 cents per kilowatthour, in 1992, to 8.32 cents per kilowatthour in 1993. Revenue for the nonresidential sector increased by 3 percent in 1993. The average revenue per kilowatthour for the nonresidential sector increased by 1 percent from 6.07 cents per kilowatthour, in 1992, to 6.15 cents per kilowatthour in 1993.

Sales by Ownership. Among the ownership classes, investor-owned electric utilities accounted for 76 percent (2,187 billion kilowatthours) of total U.S. sales of electricity in 1993 (Table 4). Publicly owned electric utilities accounted for 14 percent (407 billion kilowatthours); electric cooperative utilities accounted for 8 percent (221 billion kilowatthours); and Federal electric utilities accounted for 2 percent (46 billion kilowatthours) of total U.S. sales in 1993. Investor-owned electric utilities reported a 4-percent increase (75 billion kilowatthours) in sales to ultimate consumers

and publicly owned utilities, a 3-percent increase (12 billion kilowatthours) in 1993, compared with 1992. Sales by cooperative electric utilities increased by 7 percent (14 billion kilowatthours). Federal electric utilities reported a 5-percent decrease in sales (2 billion kilowatthours).

Revenue by Ownership. All ownership classes reported increases in revenue from sales of electricity in 1993, compared with 1992. Publicly owned and cooperatively owned electric utilities each reported increases of 4 percent and 7 percent, respectively. Investor-owned electric utilities reported a 5-percent increase in 1993 revenue, while Federal electric utilities reported a less than 1-percent increase (Table 4).

Average Revenue by Ownership. In 1993, Federal electric utilities continued to have the lowest average revenue per kilowatthour at 2.77 cents, an 6-percent increase from 1992 (Table 11). Federal electric utilities generally have lower average revenue per kilowatthour because they are exempt from income tax, have access to lower interest loans, and generate less expensive hydroelectric power. In addition, many Federal hydroelectric projects are multi-purpose projects, and only a portion of the costs are allocated to electricity.

Investor-owned utilities had an average revenue per kilowatthour of 7.16 cents in 1993, a 2-percent increase from 1992 (Table 11). Average revenue per kilowatthour for publicly owned electric utilities was 6.09 cents, and for cooperative electric utilities, it was 7.00 cents, both lower than the average revenue per kilowatthour of investor-owned utilities. Publicly owned utilities have access to low-cost capital and are not allowed to charge a return for profit. Although cooperative electric utilities have access to low-cost loans through the Rural Electrification Administration, the high average revenue per kilowatthour by this ownership group is at least partly attributable to the high cost of operating in remote rural areas having a low concentration of consumers and to providing service to a higher percentage of residential customers than other classes of utilities. The lower load factor of residential customers, compared with other sectors (i.e., commercial and industrial), has an associated higher allocation of demand cost due to a lower utilization of generating equipment. In addition, many cooperatives do not generate electricity, but as full requirement customers of electric utilities with generating facilities, must pay requirement demand charges.

Table 1. U.S. Sales to Ultimate Consumers and Associated Revenue by Sector, 1993

Item	Residential	Commercial	Industrial	Other ¹	All Sectors

Sales and Revenue

This chapter provides a discussion on revenue requirements, the allocation of revenue across sectors, and rate schedules. Also provided are summary statistics on the sales of electricity to ultimate consumers and the associated revenue. This information is provided at the national, Census division, and State level.

Cost of Electricity

The process of determining the cost of electricity generally follows three stages: (1) revenue requirements are determined, (2) the revenue requirement is allocated to different classes of service (sectors), and (3) rate schedules for each sector are established.

Revenue Requirements. Revenue requirements are set to reimburse the electric utility for providing electric service. The revenue requirements reflect the anticipated cost of providing services for some period of time in the future, usually a year. Revenue requirements include investment depreciation, expenses for the production, transmission, and distribution systems, as well as sales costs, consumer costs, Federal and other taxes, and administration and general expenses. The revenue requirements also include an allowance for the profit of the electric utility, if applicable.

Allocation of Revenue. The cost of service to particular sectors and the mix of consumers served in the sectors provide guidelines for determining how much of the revenue must be collected from each sector. For example, the cost of service to the residential sector is usually higher than the cost to the commercial or industrial sectors because of the large number of consumers served, amount of distribution lines needed to provide the service, and the low consumption levels. The economic activity or type of business of the ultimate consumer is not necessarily the means by which electric utilities classify their consumers to determine revenue requirements and set rates. Electric utilities, in many instances, determine their revenue requirements and set their rates based on the level of demand and/or consumption of electricity.

The residential sector represents 88 percent of the total number of consumers but only accounts for 35 percent of the total sales of electricity and 42 percent of the revenue from those sales. The industrial sector consists of less than 1 percent of the total number of consumers but accounts for 34 percent of the sales and 24 percent

of the revenue. The commercial sector consists of 11 percent of the consumers and accounts for 28 percent of total sales and 31 percent of the revenue. The remaining share of sales is accounted for by the "other" sector, which includes public street and highway lighting, railroads and railways, municipalities, divisions or agencies of State and Federal Governments under special contracts or agreements, and other utility departments, as defined by the pertinent regulatory agency and/or electric utility. Investor-owned electric utilities serve approximately three-fourths of the total number of ultimate consumers. Publicly owned electric utilities and electric cooperatives serve nearly all the remaining ultimate consumers, because federally owned electric utilities have very few retail customers and sell almost exclusively to other electric utilities.

Rate Schedules. In general, the rate schedules for electric utilities are designed to reimburse utilities for operation, generation, maintenance, rental fees for equipment, and demand and service charges. Operation, generation, maintenance, and rental fees for equipment are usually fixed charges that are assessed monthly or annually. Demand charges are often fixed, but they can vary with the peak demand of the customer. Energy charges vary with the amount of electric energy delivered to consumers. A more detailed discussion of these charges is contained in the chapter, "Average Revenue per Kilowatthour."

The rate schedules developed by electric utilities are unique to each utility. The rates reflect any number of considerations that are important to the economic welfare of the electric utility and may reflect other interests as well, such as residential rates that provide economical service to low-income families. Generally, commercial or industrial billings are determined more by the levels of demand and consumption of electricity than by the type of economic activity in which the consumer is engaged.

For instance, while commercial and industrial consumers are billed according to a particular rate schedule that frequently reflects the type of business indicated by that schedule, there are exceptions. A light manufacturing establishment with a manufacturing process that consumes little energy could be billed at a commercial rate because its consumption is not high enough to fall into the industrial schedule. Conversely, a very large commercial building might have sufficiently large consumption to be billed at the industrial rate.

Sectorial classification of consumers is based on different criteria such as demand level, rates, Standard Industrial Classification (SIC) code, accounting methods, end-use activity, and other social and economic characteristics. Reclassification of consumers, usually between the commercial and industrial sectors, may occur from year-to-year due to changes in demand level or economic or other factors.

The authority for the approval of rate schedules is based on the class of utility ownership. Investor-owned electric utilities are regulated by State public service commissions and the Federal Energy Regulatory Commission. Publicly owned and cooperative electric utilities, in most States, are regulated by their consumer-

owners through locally elected or appointed officials. A more detailed discussion on utility classes of ownership is contained in the "Background" section of the Profile chapter in this publication.

Data Sources. Tables 3 through 10 contain data on the retail sales of electricity, its associated revenue, and the average number of consumers at the national, Census and State levels by sector and class of utility ownership. Statistics contained in Tables 3 through 10 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are not included in the summary statistics.

Average Revenue per Kilowatthour

This chapter provides summary statistics on the average revenue per kilowatthour at the national, Census division, State, and electric utility levels.

Average Revenue per Kilowatthour at the National, Regional, and State Level

The average revenue per kilowatthour by sector and State is calculated by dividing total annual revenue by total annual retail sales for each sector and State. The resulting statistic is the average revenue per kilowatthour sold by consumer sector. Many rate schedules have a minimum service charge and most have a declining rate per unit of consumption as consumption increases. Rate schedules for the commercial and industrial sectors almost always have a demand charge in addition to an energy charge. These charges lower the average revenue per kilowatthour as the consumption increases.

The average revenue for the residential sector is generally higher than for any other sector, due in part to the relatively small consumption level per consumer and the relatively lower load factor. The load factor is average load expressed as the percentage of the peak load. Generally, a consumer whose average load is low relative to its maximum demand is more costly to serve than a consumer whose load factor is higher. Residential consumers typically have lower load factors than industrial consumers.

Average revenue for the residential and commercial sectors increased fairly consistently from 1989 to 1993, but the average revenue for the industrial sector remained relatively flat. The residential sector's average revenue climbed 0.67 cents per kilowatthour, from 7.65 cents in 1989 to 8.32 cents in 1993; and the commercial sector climbed 0.54 cents per kilowatthour, from 7.20 cents in 1989 to 7.74 cents in 1993. The other sector showed an increase in average revenue of 0.63 cents per kilowatthour, from 6.25 in 1989 to 6.88 cents in 1993. The industrial sector increased by 0.13 cents to 4.85 cents in 1993, from 4.72 cents in 1989. The relatively small change in average revenue for the industrial sector indicates that some State utility commissions, during 1989 to 1993, probably approved lower rates for industrial consumers to better reflect the cost of services (Table 11).

The average revenue by ownership class also exhibits some interesting trends. Both investor-owned and publicly owned utilities show upward trends in average revenue, while the cooperatives remain relatively flat. In 1993, the investor-owned utility average revenue surpassed the cooperative's average revenue for the second year in the last five-year period. The average revenue for Federal utilities continues to decline, falling from 3.64 cents in 1989 to 2.77 cents in 1993.

Utility Demand-Side Management (DSM) programs designed to reduce system peak demands and energy requirements have become important components of utility load and resource plans. DSM programs are designed to modify consumption patterns and increase the efficient use of electricity. As a result, these programs may play a role in changing the consumers' average consumption and average revenue per kilowatthour. The recently enacted Energy Policy Act of 1992 contains a section that promotes conservation and energy efficiency by encouraging utilities to expand DSM programs. It requires utilities and public utility commissions to consider requiring two new Federal standards that encourage DSM: (1) integrated resource planning, which includes consideration of demand-side options with supply-side options, and (2) cost recovery for energy efficiency programs that allows their profitability to be at least as attractive as supply-side option profitability.

Public concerns and stricter Federal and State environmental standards have forced electric utilities to reduce the release of air pollutants from power plants. The Clean Air Act Amendments of 1990 will result in the installation of additional pollution control and/or monitoring equipment and potential shifting to relatively higher cost, lower sulfur fuels that will eventually affect utility revenue requirements and may increase electricity rates.

Federal electric utilities generally have the lowest average revenue per kilowatthour for the ownership classes because they have access to relatively low-cost financing and generally utilize less expensive hydro-electric facilities. Because publicly owned electric utilities also have access to relatively low-cost financing and are nonprofit entities, they have lower average revenue per kilowatthour than investor-owned electric utilities. Although cooperative electric utilities have economic advantages similar to those of the publicly owned electric utilities, they generally serve sparsely

**Table 11. U.S. Average Revenue per Kilowatthour by Sector and Class of Ownership,
1989 Through 1993
(Cents)**

Item	1993	1992	1991	1990	1989
All Sector					
Residential	8.32	8.21	8.04	7.83	7.65
Commercial	7.74	7.66	7.53	7.34	7.20

populated areas and provide service to a higher percentage of rural residential customers than other classes of utilities. As a consequence, cooperative electric utilities generally have a higher average revenue per kilowatthour than do publicly owned utilities.

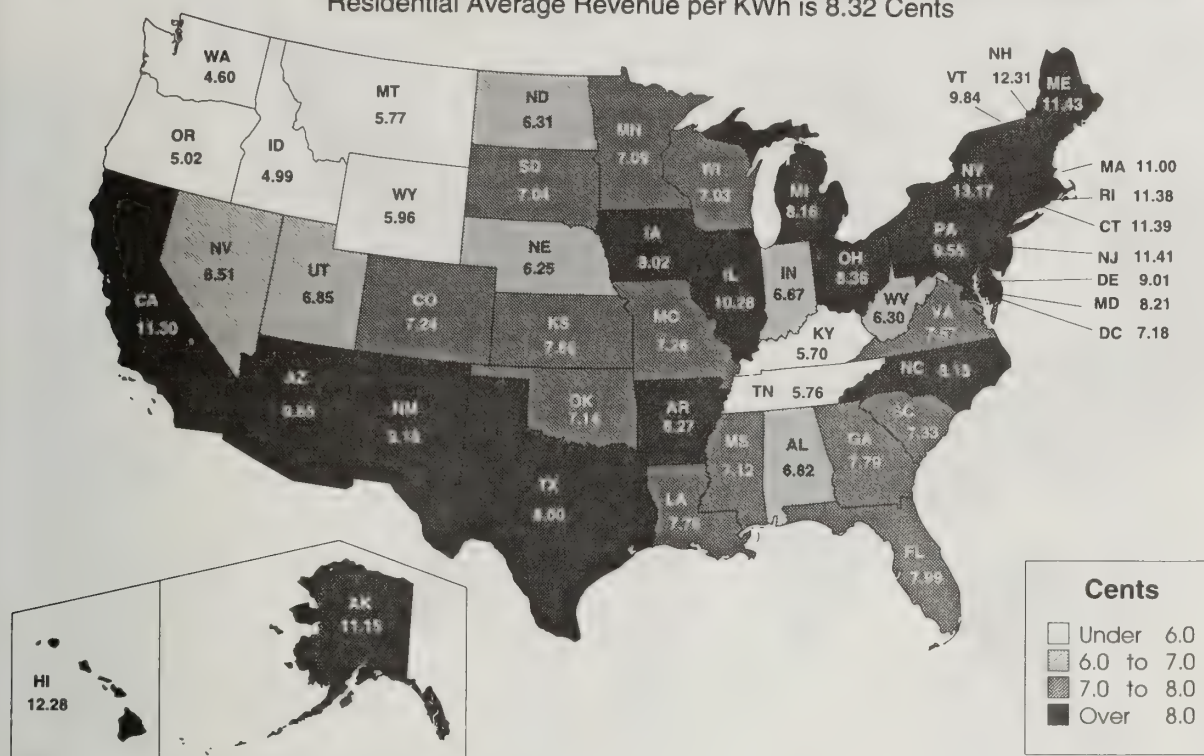

Because of the type and availability of capacity and the cost of fuel, the average revenue per kilowatthour differs across U. S. Census divisions. Petroleum is generally a more expensive energy source than coal and natural gas. Therefore, the New England and Middle Atlantic Census Divisions tend to have an average revenue per kilowatthour that is higher than the national average because of their reliance on petroleum, whereas the East and West South Central Divisions rely on gas-fired generation and the East North Central and South Atlantic Census Divisions rely on coal-fired

generation. Because the Mountain Census Division relies on less expensive hydroelectric generation, the average revenue per kilowatthour in this region is usually below the national average for all classes of consumers. The Census divisions where Federal hydroelectric facilities provide significant amounts of electricity, such as the East South Central Census Division, also have lower than average revenue per kilowatthour.²

Tables 11 through 13 contain summary statistics on the average revenue per kilowatthour of electricity sold at the national, Census division, and State level by sector and class of utility ownership. Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are not included in the summary statistics.

Notes: •Data for 1993 are final. •The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.
Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

Average Revenue per Kilowatthour at the Electric Utility Level

The average revenue per kilowatthour of electricity sold for each utility is calculated in this report by dividing the total annual revenue of the electric utility by its total annual sales of electricity across all sectors. Because the average revenue per kilowatthour varies between sectors, the difference in average revenue per kilowatthour between utilities may represent a difference in their proportion of sales in the different sectors. Accordingly, the average revenue for a given utility does not reflect the differences that may exist in its revenue structure across sectors. The average revenue per kilowatthour at the utility level is usually between 4 and 12 cents per kilowatthour, but the average may be larger or smaller for a particular sector, ownership type, or State.

Cooperative electric utilities are owned by their members and are established to provide electricity to those members. These electric utilities operate in rural areas with a lower concentration of consumers because these areas were historically viewed as uneconomical operations for investor-owned electric utilities. Cooperative electric utilities generally have broader service areas with smaller consumer bases than other ownership types and, as a consequence, they tend to have higher average revenue per kilowatthour. Cooperative electric utilities that serve consumers in multiple States tend to have even broader service areas and higher average revenue per kilowatthour. Average cents per kilowatthour are not provided in Tables 14 through 17 for those cooperative electric utilities or other electric utilities with revenue below \$100,000 or sales below 1,000 megawatthours.

For example, the Columbus Electric Cooperative, Incorporated, in New Mexico serves consumers in New Mexico as well as in Arizona. The residential average revenue per kilowatthour in Table 14 is 13.1 cents in New Mexico and 12.7 cents in Arizona. The commercial average revenue per kilowatthour in Table 15 is 11.6 cents for New Mexico. The commercial average revenue per kilowatthour is not provided for Arizona because the electric utility reported either less than \$100,000 of revenue or 1 million kilowatthours of sales in this State.

Of the 83 reporting electric utilities in Alaska, 81 utilities have average revenue per kilowatthour exceeding the U.S. average. This occurs in part due to the lack of economies of scale in Alaska and because of the high costs associated with generation and distribution. The electric utilities that have higher costs charge higher rates for electricity to recover these costs from their consumers. The Power Cost Equalization (PCE) subsidy by the State of Alaska was initially designed to compensate consumers served by electric utilities located in rural areas where transmission access is lim-

ited and electric power generation is with expensive diesel gas turbines. The Alaska Energy Authority (AEA) administers the subsidy with funds from a State statute since Alaska has no State income tax. Electric utilities qualifying for the PCE program are required to notify consumers of the cost of electric service and the cost minus the State equalization. Consumers receiving the subsidy do not actually pay the high rates. The subsidy is allocated to electric utilities based on consumer sector and demand for electricity within each sector. In Tables 14 through 17, the PCE subsidy has not been subtracted from the total revenue of those electric utilities receiving compensation for high energy costs.

Electric utilities operating on islands with high seasonal populations also tend to have much higher average revenue per kilowatthour. Higher demand charges are needed to recover the fixed equipment and operating costs associated with generating electricity at infrequent times. These electric utilities are few and are primarily located on the East Coast and in the Great Lakes area.

Data on the number of consumers, revenue, sales, and average revenue per kilowatthour for individual electric utilities are contained in Tables 14 through 17. The average revenue per kilowatthour presented in Tables 14 through 17 are based on an average for each of the end-use sectors. When an electric utility provided service to ultimate consumers in more than one State, that utility is listed under each State it serviced. The electric utilities in Table 14 through 17 that provided service to ultimate consumers in more than one State and their percent of sales in each State are shown in Appendix A. Tables 14 through 16 contain the respective consumers, sales, revenue, and average revenue per kilowatthour by each sector for all electric utilities. Table 17 contains the respective sales, revenue, and average revenue for the sum of all sectors. This includes the residential, commercial, and industrial sectors, as well as public street and highway lighting, interdepartmental sales, sales to railroads and railways, and sales to other public authorities.

Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales is not provided because the significance of these data is not sufficient to make the ratio meaningful. See Appendix B for further information.

Data Sources. Statistics contained in Tables 11 through 17 are based on data collected on the Form EIA-861, "Annual Electric Utility Report." Data for the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands are included only in Tables 14 through 17, but not in the summary statistics.

Total (Includes the Four Power Authorities)		102,035,637	83,272,057	1,000,359,556	8.32

¹ The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

² Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity. PCE subsidy has not been subtracted from the total revenue of those utilities receiving compensation for high energy costs.

³ The U.S. total excludes the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Notes: •Data for 1993 are final. •Power authorities are not included in aggregated statistics unless specified. •Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

Total (Includes the Four Power Authorities)		12,648,113	62,164,470	800,619,310	7.76

¹ The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

² Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity. PCE subsidy has not been subtracted from the total revenue of those utilities receiving compensation for high energy costs.

³ The U.S. total excludes the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Notes: •Data for 1993 are final. •Power authorities are not included in aggregated statistics unless specified. •Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

Total (Includes the Four Power Authorities)		556,562	47,687,695	981,061,176	4.86

¹ The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

² Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity. PCE subsidy has not been subtracted from the total revenue of those utilities receiving compensation for high energy costs.

³ The U.S. total excludes the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Notes: •Data for 1993 are final. •Power authorities are not included in aggregated statistics unless specified. •Electric utilities serving consumers in more than one State are listed under each State served.

Source: Energy Information Administration, Form EIA-861, "Annual Electric Utility Report."

¹ The average revenue per kilowatthour of electricity sold is calculated by dividing revenue by sales.

² Most electric utilities in the State of Alaska that have average revenue per kilowatthour exceeding the U.S. average compensate their rural consumers through the State of Alaska Power Cost Equalization (PCE) program. The PCE program was designed to offset the high generation and distribution costs that must otherwise be passed on to consumers in the form of high rates for electricity. PCE subsidy has not been subtracted from the total revenue of those utilities receiving compensation for high energy costs.

³ The U.S. total excludes the four power authorities of American Samoa, Guam, Puerto Rico, and the Virgin Islands.

⁴ Electric revenue and sales data are reported by electric utilities in thousand dollars and thousand kilowatthours. Average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales are not provided because the significance of the data are not sufficient to make the ratio meaningful.

Notes: •Data for 1993 are final. •Power authorities are not included in aggregated statistics unless specified. •All sectors include residential, commercial, industrial, and other customers. •Electric utilities serving consumers in more than one State are listed under each State served.

Appendix A

Electric Utilities Serving Ultimate Consumers in More Than One State

This appendix contains information from the Form EIA-861, "Annual Electric Utility Report," regarding electric utilities that serve ultimate consumers in more than one State (Table A1). Additionally, the percent of sales of electricity in each State is included in Table A1. The information can be used as a reference to Tables 14 through 17. For example, information contained in Table A1 indicates that the Appalachian Power Company serves consumers in Virginia and West Virginia. Tables 14 through 17 contain the respective

sales, revenue, and average revenue by each sector and for all sectors for this electric utility in both States. The majority of utilities that serve ultimate consumers in more than one State are the investor-owned electric utilities. These electric utilities generally have large franchise service areas and historically have served retail consumers in more than one State. Publicly owned electric utilities usually are chartered by municipal or State governments and usually provide service within the cities or counties where they are located.

Appendix B

Technical Notes

Appendix B

Technical Notes

Sources of Data

The *Electric Sales and Revenue (ESR)* is prepared by the Survey Management Division, Office of Coal, Nuclear, Electric and Alternate Fuels (CNEAF), Energy Information Administration (EIA), U.S. Department of Energy. Data published in the *ESR* are compiled from the EIA statistical Form EIA-861, "Annual Electric Utility Report." A brief summary of the form is presented below.

Form EIA-861

The Form EIA-861 is a mandatory census of electric utilities in the United States. The survey is used to collect information on power production and sales data from approximately 3,200 electric utilities. The collected data are used to maintain and update the electric utility frame data base of the EIA. This data base supports queries from the Executive Branch, Congress, other public agencies, and the general public. Summary data from the Form EIA-861 are also contained in the *Electric Power Monthly*, the *Electric Power Annual*, the *Financial Statistics of Major U.S. Investor-Owned Electric Utilities*, and the *Financial Statistics of Major U.S. Publicly Owned Electric Utilities*. These reports present aggregate totals for electric utilities at the national, regional, and State levels by consumer classes. Data for the four power authorities of the Virgin Islands, American Samoa, Guam, and Puerto Rico are included only in Tables 14 through 17, and not in the summary statistics.

Instrument and Design History. The Form EIA-861 was implemented in January 1985 to collect data as of year-end 1984. The Federal Energy Administration Act of 1974 (Public Law 93-275) defines the legislative authority to collect these data.

Data Processing. The Form EIA-861 is mailed to the respondents in January to collect data as of the end of the preceding calendar year. The completed forms are to be returned to the EIA by May 1. These data are manually edited before being entered into the interactive on-line system. Internal edit checks are performed to verify that current data total across and between schedules, and are comparable to data reported the

previous year. Edit checks are also performed to compare data reported on the Form EIA-861 with similar data reported on the Forms EIA-826, EIA-412, and Federal Energy Regulatory Commission Form 1. Respondents are contacted by telephone to obtain clarification of reported data or to obtain missing data.

Form EIA-861 figures shown in this publication differ somewhat from the sum of the monthly Form EIA-826 figures for sales published in the *Electric Power Monthly* and in issues of the *Electric Power Annual* prior to 1988. Both forms use sectorial classifications (residential, commercial, and industrial) based on the usual classification of consumers by the electric utilities. At the national level, the Form EIA-861 and Form EIA-826 figures corresponded closely (within 3 percent) for all end-use sectors. Some larger differences were observed at the State level, particularly for Tennessee, due to inconsistent classification of commercial and industrial data between the Form EIA-826 and the Form EIA-861 surveys.

Differences between the Form EIA-861 and Form EIA-826 figures can result from the Form EIA-826 sampling procedure and/or from nonsampling error in either data collection. One source of nonsampling error in the Form EIA-826 stems from the practice of filing estimates for monthly sales and revenue when the actual figures are not yet available. Although respondents are instructed to file revisions, revisions are not always filed. The respondents are instructed to review their Form EIA-826 figures at the end of the reporting year to ensure consistency with Form EIA-861 figures. Survey analysts at the EIA compare these data series and attempt to resolve any differences. Nevertheless, some reporting differences remain.

Electric revenue and sales data are rounded and reported by electric utilities in thousand dollars and thousand kilowatthours. For this publication the average revenue per unit cost of electricity sold is calculated by dividing total electric revenue by the total sales of electricity. For Tables 14 through 17 the average revenue per kilowatthour for electric utilities with either less than \$100,000 of revenue or less than 1 million kilowatthours of sales, is not provided because the significance of the data is not sufficient to make the ratio meaningful.

Quality of Data

The CNEAF office is responsible for routine data improvement and quality assurance activities. All operations in this office are done in accordance with formal standards established by the EIA. These standards are the measuring rod necessary for quality statistics. Data improvement efforts include verification of data-keyed input by automatic computerized methods, editing by subject matter specialists, and followup on nonrespondents. The CNEAF office supports the quality assurance efforts of the data collectors by providing advisory reviews of the structure of information requirements and of proposed designs for new and revised data collection forms and systems. Once implemented, the actual performance of working data collection systems is also validated. Computerized respondent data files are checked to identify those who fail to respond to the survey. By law, nonrespondents may be fined or otherwise penalized for not filing a mandatory EIA data form. Before invoking the law, the EIA tries to obtain the required information by encouraging cooperation of nonrespondents.

Completed forms received by the CNEAF office are sorted, screened for completeness of reported information, and keyed onto computer tapes for storage and transfer to random access data bases for computer processing. The information coded on the computer tapes is manually spot-checked against the forms to certify accuracy of the tapes. To ensure the quality standards established by the EIA, formulas that use the past history of data values in the data base have been designed and implemented to automatically check data input for errors. Data values that fall outside the ranges prescribed in the formulas are verified by telephoning respondents to resolve any discrepancies.

Data Editing System

Data from the Form EIA-861 are edited on an annual basis using automated systems. The edits include both deterministic checks, in which records are checked for the presence of required fields and their validity, and statistical checks, in which estimation techniques are used to validate data according to their behavior in the past and in comparison to other current fields.

Confidentiality of the Data

The data collected on the forms used for input to this report are not confidential.

Formulas

Average Revenue per Kilowatthour. The average revenue per unit cost of electricity sold is calculated by dividing total annual revenue by total annual sales of electricity.

Calculation Effects of Average Revenue Per Kilowatthour and Sales on Revenue.

Δr = Change in average revenue from year₁ to year₂ = $r_2 - r_1$

ΔS = Change in sales from year₁ to year₂ = $S_2 - S_1$

ΔR = Change in revenue from year₁ to year₂ = $R_2 - R_1$

$\Delta R = (S_2)\Delta r + (r_1)\Delta S$

Effect of change in average revenue on change in

revenue =
$$\frac{(S_2)\Delta r}{(S_2)\Delta r + (r_1)\Delta S} * 100 \%$$

Effect of change in sales on change in revenue =
$$\frac{(r_1)\Delta S}{(S_2)\Delta r + (r_1)\Delta S} * 100 \%$$

Rounding Rules for Data

Given a number with r digits to the left of the decimal and $d+t$ digits in the fraction part, with d being the place to which the number is to be rounded and t being the remaining digits that will be truncated, this number is rounded to $r+d$ digits by adding 5 to the $(r+d+1)$ th digit when the number is positive or by subtracting 5 when the number is negative. The t digits are then truncated at the $(r+d+1)$ th digit. The symbol for a rounded number truncated to zero is (*).

Data Correction Procedure

The CNEAF office has adopted the following policy with respect to the revision and correction of the Form EIA-861 data published in this report and made available in a machine format:

- Publication of these data results in their finalization at which point the data base is closed.
- Revisions or corrections are made only in the event a substantial (greater than 1 percent) reporting change is received or a substantial (greater than 1 percent) error is discovered.
- No revisions will be made without the approval of the Director, Survey Management Division.

Table B1. Unit-of-Measure Equivalents for Electricity

Unit	Equivalent		
Kilowatt (kW)	1,000	(One Thousand)	Watts
Megawatt (MW)	1,000,000	(One Million)	Watts
Gigawatt (GW)	1,000,000,000	(One Billion)	Watts
Terawatt (TW)	1,000,000,000,000	(One Trillion)	Watts
Gigawatt	1,000,000	(One Million)	Kilowatts
Thousand Gigawatts	1,000,000,000	(One Billion)	Kilowatts
Kilowatthours (kWh)	1,000	(One Thousand)	Watthours
Megawatthours (MWh)	1,000,000	(One Million)	Watthours
Gigawatthours (GWh)	1,000,000,000	(One Billion)	Watthours
Terawatthours (TWh)	1,000,000,000,000	(One Trillion)	Watthours
Gigawatthours	1,000,000	(One Million)	Kilowatthours
Thousand Gigawatthours	1,000,000,000	(One Billion)	Kilowatthours

Obtaining Copies of Data or the Form

Upon EIA approval of the *Electric Sales and Revenue*, the data become available for public use. Computer listings may be obtained by submitting a written request to:

Energy Information Administration, EI-521
Forrestal Building
U.S. Department of Energy
Washington, DC 20585

These data are also available on machine-readable tapes. Tapes may be purchased by using Visa, Master Card, or American Express cards, as well as money orders or checks payable to the National Technical Information Service (NTIS). Purchasers may also use NTIS and Government Printing Office depository ac-

counts. To place an order, contact:

National Technical Information Service (NTIS)
Office of Data Base Services
U.S. Department of Commerce
5285 Port Royal Road
Springfield, Virginia 22161
(703) 487-4650

Copies of the form and its instructions may be obtained from the National Energy Information Center (NEIC). The address and telephone number appear below.

National Energy Information Center, EI-231
Energy Information Administration
Forrestal Building, Room 1F-048
Washington, DC 20585

Glossary

Base Bill: A charge calculated by taking the rate from the appropriate electric rate schedule and applying it to the level of consumption.

Base Rate: A fixed per kilowatthour charge for electricity consumed that is independent of other charges and/or adjustments.

Block Rate Schedule: An electric rate schedule with a provision for charging a different unit cost for various increasing blocks of demand or energy. Usually a reduced price is charged on succeeding blocks.

Census Divisions: The nine geographic divisions of the United States established by the Bureau of the Census, U.S. Department of Commerce for statistical analysis. The boundaries of Census divisions coincide with State boundaries. The Pacific Division is subdivided into the Pacific Contiguous and Pacific Noncontiguous areas.

Classes of Service: Consumers grouped by similar characteristics in order to be identified for the purpose of setting a common rate for electric service. Usually classified into groups identified as residential, commercial, industrial and other.

Class Rate Schedule: An electric rate schedule applicable to one or more specified classes of service, groups of businesses, or customer uses.

Commercial Sector: The commercial sector is generally defined as nonmanufacturing business establishments, including hotels, motels, restaurants, wholesale businesses, retail stores, and health, social, and educational institutions. Electric utilities may classify commercial service as service that includes all consumers whose demand or annual use exceeds some specified limit. The limit may be set by the utility based on the rate schedule of the utility. Consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifica-

tions, should be classified based on the schedule they most closely resemble. If there is no rate schedule distinction, utilities may define commercial consumers as those having a demand of less than 1000 kilowatts.

Consumer Charge: An amount charged periodically to a consumer for such utility costs as billing and meter reading, without regard to demand or energy consumption.

Cooperative Electric Utility: A group organized under the law into a utility company that will generate, transmit, and/or distribute supplies of electric energy to a specified area not being serviced by another utility. Such ventures are generally exempt from the Federal income tax laws. Most electric cooperatives have initially been financed by the Rural Electrification Administration, U.S. Department of Agriculture.

Cost of Service: A ratemaking concept used for the design and development of rate schedules to ensure that the filed rate schedules recover only the cost of providing the electric service at issue. These costs include operating and maintenance expenses, depreciation and amortization expenses, and income and other taxes found just and reasonable by the regulatory agency for ratemaking purposes plus, in the case of privately owned electric utilities, an allowance for a return on capital (usually computed by applying a rate of return to the rate base). This concept attempts to equate the cost incurred by the utility to the revenue received for the service provided to each of the consumer classes.

Demand (Electric): The rate at which electric energy is delivered to or by a system, part of a system, or piece of equipment, at a given instant or averaged over any designated period of time.

Demand Charge: That portion of the consumer's bill for electric service based on the consumer's maximum electric capacity usage and calculated based on the

billing demand charges under the applicable rate schedule.

Energy Information Administration (EIA): An independent agency within the U.S. Department of Energy that develops surveys, collects energy data, and does analytical and modeling analysis of energy issues. The Agency must meet the requests of Congress, other elements within the Department of Energy, Federal Energy Regulatory Commission, the Executive Branch, its own independent needs, and assist the general public, or other interest groups, without taking a policy position.

Economy of Scale: The principle that larger production facilities have lower unit costs than smaller facilities.

Electric Power Industry: The privately, publicly, federally and cooperatively owned electric utilities of the United States taken as a whole. This includes all electric systems serving the public: regulated investor-owned electric utility companies; Federal power projects; State, municipal, and other government-owned systems, including electric public utility districts; electric cooperatives, including generation and transmission entities. Excluded from this definition are the special purpose electric facilities or systems that do not offer service to the public.

Electric Rate: The price set for a specified amount of electricity in an electric rate schedule or sales contract.

Electric Rate Schedule: A statement of the electric rate and the terms and conditions governing its application, including attendant contract terms and conditions that have been accepted by a regulatory body with appropriate oversight authority.

Electric Utility: An enterprise that is engaged in the generation, transmission, or distribution of electric energy primarily for use by the public and that is the major power supplier within a designated service area. Electric utilities include privately owned, publicly owned, cooperatively owned, and government-owned (municipals, Federal agencies, State projects, and public power districts) systems.

Energy: The capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic en-

ergy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units.

Federal Energy Regulatory Commission (FERC): A quasi-independent regulatory agency within the Department of Energy having jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification.

Flat and Meter Rate Schedule: An electric rate schedule consisting of two components, the first of which is a service charge, and the second a price for the energy consumed.

Flat Demand Rate Schedule: An electric rate schedule based on billing demand that provides no charge for energy.

Gigawatt (GW): One billion watts.

Gigawatthour (GWh): One billion watthours.

Industrial Sector: The industrial sector is generally defined as including manufacturing, construction, mining, agriculture, fishing, and forestry establishments under Standard Industrial Classification (SIC) codes 01-39. The utility may classify industrial service using the SIC codes, or based on demand or annual usage exceeding some specified limit. The limit may be set by the utility based on its own rate schedule. Sales for consumers (i.e. farms and irrigation) that the utility has no system for separating into residential, commercial, and industrial classifications, should be classified based on the classification of their rate most closely resembles. If there is no rate schedule distinction, utilities may define industrial consumers as those having a demand equal to or greater than 1,000 kilowatts.

Interdepartmental Sales: Includes amounts charged by the electric department at tariff or other specified rates for electricity supplied by it to other utility departments.

Investor-Owned Electric Utility: A class of utility that is investor owned and organized as a tax paying business, usually financed by the sales of securities in the capital market.

Kilowatt (kW): One thousand watts.

Kilowatthour (kWh): One thousand watthours.

Megawatt (MW): One million watts.

Megawatthour (MWh): One million watthours.

Other Sector: Electricity supplied to public street and highway lighting, other service to public authorities, service to railroads and railways, and interdepartmental service.

Power (Electrical): An electric measurement unit of power called a voltampere is equal to the product of 1 volt and 1 ampere. This is equivalent to 1 Watt for a direct current system and a unit of apparent power is separated into real and reactive power. Real power is the work-producing part of apparent power that measures the rate of supply of energy and is denoted as kilowatts (KW). Reactive power is the portion of apparent power that does no work and is referred to as kilovars; this type of power must be supplied to most types of magnetic equipment, such as motors, and is supplied by generator or by electrostatic equipment. Voltamperes are usually divided by 1,000 and called kilovoltamperes (kVA). Energy is denoted by the product of real power and the length of time utilized; this product is expressed as kilowatthours.

Public Authorities: Electricity supplied to municipalities or divisions or agencies of State and Federal governments, usually under special contracts or agreements that are applicable only to public authorities.

Public Street and Highway Lighting Service: Electricity supplied and services rendered for the purpose of lighting streets, highways, parks, and other public places; or for traffic or other signal system service, for municipalities, or other divisions or agencies of State or Federal governments.

Publicly Owned Electric Utility: A class of utility that includes those utilities operated by municipalities, po-

litical subdivisions, utility or power districts, and State and Federal power agencies.

Railroad and Railway Electric Service: Electricity supplied to railroads and interurban and street railways, for general railroad use, including the propulsion of cars or locomotives, where such electricity is supplied under separate and distinct rate schedules.

Rate Base: The value of property upon which a utility is permitted to earn a specified rate of return as established by a regulatory authority. The rate base generally represents the value of property used by the utility in providing service and may be calculated by any one or a combination of the following accounting methods: fair value, prudent investment, reproduction cost, or original cost. Depending on which method is used, the rate base includes cash, working capital, materials and supplies, and deductions for accumulated provisions for depreciation, contributions in aid of construction, customer advances for construction, accumulated deferred income taxes, and accumulated deferred investment tax credits.

Residential Sector: The residential sector includes private household establishments that consume energy primarily for space heating, water heating, air conditioning, lighting, refrigeration, cooking, and clothes drying. The classification of an individual consumer's account, where the use is both residential and commercial, is based on principal use. Apartment houses are included.

Retail: Sales covering electrical energy supplied for residential, commercial, and industrial end-use purposes. Other small classes, such as agriculture and street lighting, also are included in this category.

Rural Electrification Administration (REA): A lending agency of the U.S. Department of Agriculture, the REA makes self-liquidation loans to qualified borrowers to finance electric and telephone service to rural areas. The REA also finances the construction and operation of generating plants, electric transmission and distribution lines, or systems for the furnishing of initial and continued adequate electric services to persons in rural areas not receiving central station service.

Sales: The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. Other sales include public street and highway lighting,

other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Schedule: A statement of the pricing format of electricity and the terms and conditions governing its applications.

Seasonal Rates: Different seasons of the year are structured into an electric rate schedule whereby an electric utility provides service to consumers at different rates. The electric rate schedule usually takes into account demand based on weather and other factors.

Special Contract Rate Schedule: An electric rate schedule for an electric service agreement between a utility and another party in addition to, or independent of, any standard rate schedule.

Special Purpose Rate Schedule: An electric rate schedule limited in its application to some particular purpose

or process within one, or more than one, type of industry or business.

Tariff: A published volume of rate schedules and general terms and conditions under which a product or service will be supplied.

Time-of-Day Rate: The rate charged by an electric utility for service to various classes of customers. The rate reflects the different costs of providing the service at different times of the day.

Watt: The electrical unit of power. The rate of energy transfer equivalent to 1 ampere flowing under a pressure of 1 volt at unity power factor.

Watt-hour (Wh): An electrical energy unit of measure equal to 1 watt of power supplied to, or taken from, an electric circuit steadily for 1 hour.
